Thanks for the information Karl ! Glad to hear that there is a more
all-inclusive interpretation of the regs! As I mentioned in another
note - more often than not - that interpretation makes or breaks a
discussion of new and more efffective modes of digital communications
and sometimes how they can be used.

Season's greatings!

I'd suggest a KANTRONICS KPC-3 TNC and start with a simple terminal
program for the Mac like Zterm (available via your AOL connection)
that is shareware. The KPC-3 will come with good docs that will show
you how to connect to your HT.

I have a lot of Macintosh Ham Software on my home page that might
be of interest to you as well.

73,

FYI: The latest version of Digital Scope.FAQ <304> is on my WWW Home Page.
(All opinions are my own, including Digital Storage Scope.FAQ)

3. HTX 202 Packet problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-01 00:00:00 UTC
From: Hink@bbs.c4systm.com
Message-ID: <1996Jan01.012234.24078@c4systm.com>
Source record: 39494
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I have a young han friend that is trying to get a packet station on
the air using a Radio Shack HTX 202 and a Baypac tnc. This set up will
not work with the HTX 202, but works great when used with other radios
and ht's. There seems to be a problem with audio from the htx 202 to
the tnc. The tnc does not want to decode the htx 202 audio. But
remember, it works great with other rigs??????????
We playe dwith the deviation and it did not help the problem. I did
this in spite of the fact that i belive that it is a problem with the
audio out of the radio speaker jack, not the tx audio.
THE QUESTION IS........
Has anyone had this problem???
If so, how did you fix it??????????
Your help would be greatly appreciated.. The subject tnc has a xmas
gift for this 11 year ham.. He is dying to get this thing on the air!!
tnx and 73 Mark.. NU8Z

I would like to know if the Creative Labs Soundblaster card, along with Scheduler, can be equipped with an output function. You know, to turn something on and off with.

If not, do you know where I can obtain such a card and software?

Thanks

Jim

> restrictions on speech imposed upon ham bands, etc.

There are unlicensed Part 15 devices for data transmission,
available from many companies. These operate for the most part in the
902-928 MHz and 2400-2483.5 MHz bands.

There is the FCC-allocated Data-PCS band (2390-2400 MHz), although there
is no use of that band yet by unlicensed Data-PCS devices.

For HF operation there is the 13.553-13.567 MHz band that might
be used for some kind of unlicensed lo-power data under FCC Rule 15.225.

There is a proposal for a National Information Infrastructure band,
actually two band segments at 5 GHz, pending before the FCC.

>
>-- Lynn
>
Lynn...I am also quite puzzled by your comments. Let me first of all
assure you that none of the TNC files had been modified at all and I was
using the 'raw' selections. Consider this:- assume for example that the
parameter CRADD was set to on in the KAM. Running Kagold would NOT alter
that parameter. Setting to run in 'raw' would also not alter that
parameter. So I fail to see why you should mention the TNC files.
What I and my friend found was that CRADD etc would modify the sent
binary file.
The real question however is how KAGOLD handles binary on HF and again I
must say it is not user friendly. Perhaps you could consider
implementing something on the lines of PC-PAkratt in your next upgrade.
Incidentally I am running V9.06 now and the tests I did on HF binary
were with an much earlier version. Perhaps things have changed ??.
Could you also expand on what 'a few minor issues are'?
73 de Gerry (who still thinks KAGOLD is the BEST)

)My understanding is that is the case - but it depends on the
)interpretation - and others have told me that there is room for
)"interpretation" :-) and perhaps implementation. One point that was

)made to me by Lynn at Interflex is that pactor unlike packet is
)half-duplex which complicates the picture even more.

Amateur packet radio is, in most cases, half duplex in nature. A single radio is used, and can only transmit or receive at a given time.

PACTOR is somewhat more restrictive in a half duplex sense, in that it ping-pongs. The other end needs to pass control back, though there are methods provided in AMTOR (and probably the rest) that allow grabbing the link back.

)
)My personal opinion is that the perhaps the US regs are a little too
)detailed and that they might/could/do? inhibit experimentation and
)subsequently, development - BUT I suspect there is good reason for the
)way they have developed over time. Numerous times I have seen
)discussions in the various groups about new modes finally stall out on
)" is it allowed under the regs?" That may be the price to pay
)however to maintain order on the bands.

All digital codes are allowed under US regs. The general wording is that you've got to ID in morse if you're using some newly devised encoding, but a recent FCC statement held that Pactor, Gtor, Clover, etc. are all within the spirit of RTTY, etc., and that IDing in the mode, rather than morse was OK (that's how I interpreted the info from the FCC).
)
)Certainly, in Canada, and perhaps elsewhere, we are in much better
)position to use new digital modes without worry as to whether or not
)their "characteristics" meet the requiremnts of the regs. We do have
)to watch our privileges, bandwidth, callsign identification and the
)agreements as to the "bandplans".

We don't have and more restrictive rules, though we seem to have a lot of folks who read more into what we do have than the FCC does...

10. Help, sl0 does not exist!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-01 00:00:00 UTC
From: rbutler@worf.netins.net
Message-ID: <4c97h4$bsl@insosf1.netins.net>
Source record: 39587

Hello, I am trying to install a slip line using slattach, when I type
netstat -ain, it does not list sl0, and slattach will not find sl0...
I am trying to do this so that I can interface TNOS for linux to the
Linux kernel. Here is the bad stuff I found from dmesg:

```
SLIP: version 0.8.3-NET3.019-NEWTTY (dynamic channels, max=256)
(6 bit encapsulation enabled)
CSLIP: code copyright 1989 Regents of the University of California
AX25: KISS encapsulation enabled
sl0: transmit timed out, bad line quality?
ERROR 'sl0' busy and not MOD_IN_USE.
ERROR 'sl0' busy and not MOD_IN_USE.
Warning: dev (04:cf) tty->count(1) != #fd's(2) in release_dev
ERROR 'sl0' busy and not MOD_IN_USE.
```

I am using 1.3.45 of the kernel, can anyone tell me what to try or what
is wrong with my system?

Thanks.

Ryan
rbutler@worf.netins.net

If anyone is interested in experimenting with OS/2 as an alternative to
Windoze, I have a complete, in box CD version that includes the BonusPak...
manuals, boot floppies, CD's, etc, just as you'd buy it at Egghead or CompUSA.
I decided not to use it so will part with it for $25 inc. shipping.

There are some packet, sat tracking and other radio-related applications
available that run under OS/2, both commercial and free/share-ware.

Contact via email if interested.

Although your description to me is vague about what band, sensitivity, IF BW, demodulation mode, etc. you wish to use, I might suggest the Philips (used to be Signetics) NE605 or NE625 which are close in performance, and represent a combination of the (almost ubiquitous) NE602 mixer-oscillator (ie. front end/1st converter) and the NE604 2nd IF strip IC which can handle either AM (via the RSSI pin) or FM (via an external quadrature coil) or SSB (via an external BFO). Of course, you supply the filters and external matching components.

If this is far too complex, and you merely wish to receive AM Broadcast, I might recommend the (sort of famous) Plessey 3-pin TO-92 packaged radio IC called ZN-424 (or something very close to that)

Regards and God's love,
Dave Devries, Radio Design Engineer

18. Using the internet to link repeaters??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-02 00:00:00 UTC
From: TeamVideo <teamvid@198.4.75.52>
Message-ID: <4ca4sm$9h3@news.ios.com>
Source record: 39498

My repeater group has been buisily building a linked repeater system here on the east coast. We now have 13 systems on line including a remote base which is tied in Via a normal phone line on a call up basis. I have been watching an seeing new products being introduced to allow you to talk and send audio over the internet. Internet Phone is an example. I have played with Internet Phone and so far am not too impressed with the quality of the recieved audio. Neverless I thought that it might be feasable to use the internet to link repeater systems via the internet. There are providers selling flat rate service which allows you to connect and be on line without incurring additional charges. So I would like to ask has anyone tried to use the internet for this purpose? Is anyone experimenting in this area? Or can someone give me some info on the feasability of doing this. There are several systems around the country I would like to be able to link to on a comand basis while I am driving around. Obviously LD phone calls are out of the question for this purpose. Posting here is fine I'm sure others may find this interesting or if you wish my E-Mail Address is teamvid@chelsea.ios.com Happy new Year to all . Thanks

Larry D'Anna (WA3KOK)

STS-72 should launch Jan. 10, 1996!!!

SPARTAN PACKET RADIO EXPERIMENT (SPRE)

Setup Information for Participating School Ground Stations

By: Ken McCaughey (N3FZX)
File: school01.txt
Date: 20-DEC-95

1.0 INTRODUCTION

The Spartan Packet Radio Experiment (SPRE) is open to amateur radio operators and schools who want to participate. This document will guide you in your preparations for the SPRE mission. Included are some guidelines that will help you to determine if you can hear SPRE and what level of equipment you will need. Please read this document thoroughly. If you have any additional questions please contact the SPRE Project (see Section 10.0).

2.0 MISSION PROFILE

SPRE is one of four experiments on-board NASA Goddard's Spartan OAST-Flyer spacecraft, also known as SP-206. The Spartan spacecraft is one of the primary payloads on the STS-72 shuttle mission slated to launch January 11, 1996.

SPRE is designed to relay ground station positions and transmit telemetry containing the GPS location of the spacecraft and housekeeping data. The GPS data is generated by another Spartan experiment and sent to SPRE via a serial connection. Special software called APRtrak (tm) will be used at SPRE ground stations to provide a mechanism to plot the positions of stations and objects world-wide using SPRE transmissions. Ground stations can transmit their locations to SPRE, and if heard, SPRE will relay GPS information back to Earth. All ground stations within range of SPRE will see the relayed station locations plotted on a map. APRtrak system can plot and track both fixed and mobile ground stations. The APRtrak software will decode and display SPRE housekeeping telemetry including temperatures, voltages, and system status, along with the geographical positions.

SPRE can be used as an educational tool in many classes including math, science, and geography. The APRtrak software with its colorful graphics and maps is available on Internet for installation on IBM compatible computers. Even if a school is not in session during a fly-over, a simple packet radio station can be set up to listen to the SPRE telemetry and record the data for later use.

The spacecraft will be deployed by the robot arm 3 days and 2 hours (3/02:00:00) Mission Elapsed Time (MET). After deployment the shuttle will distance itself away from Spartan (up to 100 miles). The battery powered spacecraft will perform its mission following a preprogrammed routine.

SPRE operations will start 2 hours and 41 minutes after the deployment and continue for approximately 46 hours. During the mission the attitude of the spacecraft will be changing. The spacecraft will make about 33 orbits before retrieval.

Near the End-of-Mission (EOM) the shuttle will approach the spacecraft for pickup. At approximately 5/00:30:00 MET the spacecraft will be grappled by the robot arm and returned to its berth in the cargo bay, thus ending the Spartan 206 mission.

Mission Summary

Mission: STS-72, Space Shuttle Endeavour (OV-105)
Launch: January 11, 1996 at 09:18 UTC (60 minute launch window)
Orbit: 28.45 Degrees Inclination
Landing: January 20, 1996 at 04:54 UTC at KSC

Spartan Deploy: ~3/02:23:00 MET
SPRE mission: Starting 2 hours 40 minutes after Spartan deployment operational for approximately 46 hours
Operating Mode: FM, AFSK 1200 baud packet radio
Frequencies: 145.550 MHz Simplex
Callsign: W3EAX, unproto mode only, do not connect!
Retrieval: ~5/00:30:00 MET

3.0 BASIC SATELLITE COMMUNICATIONS TUTORIAL

This short tutorial is written with SPRE communications in mind. It does include some specific information regarding the Spartan orbit.

In order to communicate with a satellite, its antennas need to be within line of sight of the ground station antennas. When a satellite is in "line-of-sight", you can not necessarily see it. It only means there is an unobstructed path between the two points. Satellites can only be seen visually if they are passing over your location around dusk or dawn.

At an altitude of 165 miles, the Spartan spacecraft has a circular "foot print" that is approximately 1000 miles in radius with the spacecraft at the center. The foot print is the area of the Earth that is in line-of-

sight of the spacecraft. This circular foot print moves with the spacecraft. A ground station that is within the foot print is within line-of-sight of the spacecraft. Where you are within the foot print will determine the angle, or elevation, of the spacecraft above the horizon. During a pass, the spacecraft will rise and set like the Sun and Moon, only much faster.

The quality of a pass is determined by the maximum elevation during a pass. The higher the elevation, the better and longer the pass. The general rule of thumb is that a satellite needs to be at least 5 degrees above the horizon to be heard. However, this will vary depending on the station setup and local topography. A good pass will have an elevation greater than 20 degrees. Passes can last from as little as 10 seconds to as long as 10 minutes. Most satellite tracking software packages can predict passes accurately to within seconds if the orbital elements are up-to-date.

The Spartan spacecraft will be in a 28 degree inclination orbit. This means the orbit is tilted by 28 degrees with respect to the Earth's equator. Therefore the spacecraft will only be directly over head as far North or South as 28 degrees. However, since the spacecraft is 165 miles high and because of the size of the foot print, it is within radio range of stations much farther North or South.

As mentioned in the beginning of this section, the antennas of both the spacecraft and the ground station need to be in line-of-sight. This is not always the case during a satellite pass. This is because the antennas on most satellites have a degree of directionality to them. During a pass the antennas might not be pointing at the ground station antennas, or even the Earth. The orientation of a spacecraft is referred to as the attitude. In the case of SPRE, the antenna system was designed to be as independent of the spacecraft attitude as possible. However, there are some spacecraft attitudes that will result in a degraded signal. During the Spartan mission the attitude will be changing due to the other experiments.

4.0 CAN OUR SCHOOL DO THIS???

The following are some things to consider if your school wants to participate with SPRE. There are different levels of participation to be considered as well.

4.1 SPRE Passes

Before setting up any equipment it is important to determine if SPRE will fly within range of your location. If it does, the quality of the passes needs to be considered. To make this assessment, first look at a map and determine the latitude (degrees North or South of the equator) in which your school is located.

If your latitude is greater than 43 degrees, your chances are hearing or relaying through SPRE are zero.

If your latitude is between 40 and 43 40 degrees, your chances are hearing SPRE are very poor. Your chances of relaying a signal through SPRE are about zero.

If your latitude is between 35 and 40 degrees, your chances are hearing SPRE are very good. Your chances of relaying a signal through SPRE are poor without a well equipped HAM radio satellite station.

If your latitude is less than 35 degrees your chances of hearing SPRE are excellent. Your chances of relaying a signal through SPRE are good with modest equipment if there is not much competition on the uplink.

Latitude	Hearing SPRE	Relaying Through SPRE
> 43	No Chance!	No Chance!
40 - 43	Poor	Very Poor
35 - 40	Very Good	Poor
< 35	Excellent	Good

4.2 Levels of Participation

There are two levels of SPRE participation. These levels have varying complexity, interaction, and equipment requirements.

Full participation would include a setup with APRtrak and an amateur radio station capable of transmitting through SPRE. This implies that the station is at a favorable latitude (see above). The station would be operated by students with the oversight of a licensed amateur radio operator during a pass. A sophisticated station with big antennas and a high powered amplifier are not necessarily required for full participation.

The next level of participation centers around receiving data instead of the ability to transmit to SPRE. This mode of operation requires the least complex equipment and less effort. This may be the mode of choice for schools that do not have the time or resources to put together a complete station or if school is closed during a pass. APRtrak along with a TNC and almost any VHF (2 meter band) radio will work, even a hand-held radio. The antenna can be as simple quarter wave vertical. The more favorable the Latitude the simpler the equipment to receive data. The station can be operated during a pass or APRtrak can be setup to just listen and collect data. All data can be saved to the computer hard disk. All data saved to disk can be replayed on the screen!

4.3 Amateur Radio Operators

In order to get started your will need at least one licensed amateur radio operator. If there are none with in the student body or faculty then please contact Peter Budnik from the Amateur Radio Relay League (ARRL).

He has information on local amateur radio clubs, operators, and volunteer instructors in your area who may be able to assist you.

Peter Budnik
ARRL
225 Main Street
Newington, CT 06111

e-mail: pbudnik@arrl.org

4.4 Equipment and Software

The last major item to consider is the availability of the equipment. It is our suggestion to setup a station in the classroom. See the section below for details of what is equipment required. The equipment needs to be acquired, setup, and tested. This requires a certain level of organization, patience, and technical knowledge. This is where a knowledgeable amateur radio operator will be able to increase your chances or success. Unfortunately, the SPRE Project is not able to provide detailed technical support except with regards to APRtrak.

The needed software is available on the Internet. It is not too complicated, but may require some playing around to get familiar with the programs.

4.5 Successful SPRE Participation

As mentioned above it will take some coordination and planning to get setup for SPRE. It is suggested that, if possible, schools get together and combine efforts. This can also result in more student participation making it a more successful event.

5.0 GROUND STATION SETUP

This section covers the equipment needed to participate with SPRE. It has been the goal of the SPRE Project to make it as accessible as possible to the amateur radio and educational community. We have tried to make the ground station requirements as simple as possible. In general it does not take much power to communicate with SPRE. Since the SPRE foot print is so large, it is potentially within range of dozens or even hundreds of ground stations. All these signals will be competing with each other at the SPRE receiver. If there are a lot of stations transmitting at the same time, then usually the biggest signal wins. However, if a low power transmitter is sending at the right time it can get through just as easily. Always try to use the lowest amount of power needed to communicate with SPRE.

5.1 Hardware

IBM compatible PC:

Recommended configuration Minimum Configuration

386, 486, or Pentium processor XT
VGA color monitor CGA monochrome monitor
640KB RAM 640KB RAM
4MB free hard disk space 3MB free hard disk space
3.5" floppy disk drive 3.5" floppy disk drive
RS-232 Serial Port RS-232 Serial Port

Simple packet radio station setup:

- Licensed Amateur Radio Operator
- Terminal Node Controller (TNC)
~ TAPR-2 compatible
~ 1200 BAUD AFSK
- VHF Radio (amplifier recommended if transmitting to SPRE)
- VHF Antenna (beam recommended if transmitting to SPRE)

Note: If you have an amplifier and a beam antenna, it is more likely
that you will be successful in communicating with SPRE. It is
NOT, however, recommended that you purchase this equipment to
attempt communications. The length and scope of the SPRE
experiment is too narrow to justify a major expenditure.

5.2 Software

APRtrak:

APRtrak Version 0.5 is the program that is required to work with SPRE.
APRtrak is similar to another program called APRS. However, APRtrak
contains SPRE specific implementations for decoding the spacecraft
position and telemetry. It is important to get familiar with APRtrak
before the SPRE mission starts. This will increase for success rate.
APRtrak includes documentation on how to make local maps, how to run
simulations, and general information on GPS tracking.

APRtrak is available on the Internet. Below are just two of the many
places on the net where APRtrak can be found:

W3EAX, University of Maryland Amateur Radio Association:
URL ftp://w3eax.umd.edu/pub/spre/aprtrak/aprtrak.zip

AMSAT:
URL ftp://ftp.amsat.org/amsat/software/PC/tracking/aprtrak.zip

Unfortunately, APRtrak for Apple and Macintosh computers are NOT supported.

Satellite Tracking:

APRtrak has the ability to track up to ten satellites. The orbital
elements for SPRE and the shuttle may be loaded into the system. There
are many satellite tracking programs available on the Internet. The AMSAT
FTP sight has several program available. In addition, orbital elements
for satellites are available on the AMSAT site.

AMSAT:
URL ftp://ftp.amsat.org/amsat/software/PC/tracking/

6.0 PRE-FLIGHT ACTIVITIES

The following are some suggested activities to work on before the launch.

- Play around with APRtrak and replay the simulations. It is important to get familiar with APRtrak before the launch.

- Identify the latitude and longitude location of your school on the APRtrak maps.

- Generate a map of your local area. APRtrak comes with tools and instructions to generate news maps.

- Try to predict the temperature of SPRE during the passes over your location. Will it be hot because it is in the Sun or cold because it is in the Earth's shadow???

- Simulate the SPRE mission using satellite tracking software and the pre-launch orbital elements.

6.1 PRE-LAUNCH ORBITAL ELEMENTS

The preliminary orbital elements below may be used to simulate or predict when SPRE will pass over your location. It can be loaded into most any satellite tracking program. For best results, be sure your simulations use the dates and time listed in the Mission Summary above.

Note: These preliminary elements are for Spartan Spacecraft only, not the shuttle. They are subject to change.

Satellite Name: SPRE-00
Satellite NORAD Number: #40000 <--(DUMMY VALUE)
Element Set Number: 1
Elements Epoch: 96014.48984950
14 JAN 1996 @ 11:45:22.997 UTC
Orbit # at Epoch: 1
Inclination: 28.4779
RA of Ascend Node: 71.7928
Eccentricity: .001131
Arg of Perigee: 189.8166
Mean Anomaly: 358.1771
Mean Motion: 15.85695266
Acceleration/Drag: .0000177
BSTAR Drag: 0

Two Line Element (TLE) Format:

SPRE-00
1 40000U SPRE-00 96014.48984950 .00001770 00000-0 00000-0 0 11
2 40000 28.4779 71.7928 0011310 189.8166 358.1771 15.85695266 18

7.0 SPRE FLIGHT OPERATIONS

During the SPRE mission ground stations will need to have APRtrak up and running and setup for SPRE at least 15 minutes before a predicted pass. When the spacecraft initially rises above the horizon the signal will sound rather scratchy. The higher above the horizon it gets the more clear the signal will become.

Only attempt to transmit after successfully receiving some SPRE packets. Received packets are displayed at the bottom of the screen on APRtrak. If you can't hear SPRE, SPRE will most likely not hear you.

Watch the map to see other stations and the spacecraft. Do not zoom in to close or you may not see other stations. Set the zoom so that you are centered on your state and can also see at least one whole state on all sides.

7.1 OPERATING INSTRUCTIONS

DO's:

- Use APRtrak Version 0.5 to listen and/or communicate with SPRE.

- Use satellite tracking software to predict when SPRE will pass over.

- Set the comment field in APRtrak to the name of your school.

- Make sure your are recording all received data to the hard disk.

- Wait until you receive SPRE transmissions before attempting to transmit.

- Watch for other schools.

DON'Ts:

- Don't zoom in too close on the map.

- Don't attempt to connect using a conventional packet terminal program. It will not allow connects and you will be clogging the frequency with wasted transmissions.

- Don't transmit until you receive SPRE transmissions.

- If your locations has been successfully relayed by SPRE, please do not continue to transmit. Give other stations a chance to get through.

8.0 POST SPRE MISSION ACTIVITIES

The following are someone suggested activities to do shortly after the SPRE mission.

- Replay collected SPRE data using APRtrak.

- See how many other schools you heard and locate them on a map.

- Examine the telemetry and see how hot or cold the different parts of the SPRE electronics are.

- Send copies of your *.HST and *.LOG data files to the SPRE Project. We will take all the data files we receive and generate a composite file. This overview of the mission will then be made available to all schools and amateur radio operators.

9.0 QUESTIONS AND ANSWERS

Hopefully this will answer the most common questions. If not, send electronic mail to the SPRE Project (see Section 11.0 below).

Q: Do I need a GPS receiver.
A: No, APRtrack is used to setup your location parameters which are transmitted to SPRE.

Q: What is the difference between SPRE and SAREX?
A: SPRE will use packet radio in the un-connected or unproto mode. This means that stations can not connect to SPRE. This should ultimately provide more throughput. This experiment involves identifying the location of the spacecraft as well as ground stations. SPRE utilizes APRtrak with a graphical interface making it more interactive and interesting.

Q: How can I find out when SPRE is passing over my location?
A: By using satellite tracking software and up-to-date orbital elements. Tracking software and is available in the Internet. Orbital elements are also available on the Internet including the SPRE WWW home page.

Q: Can the SPRE Project tell me when the spacecraft will be passing over my location?
A: No.

Q: Where can I get updated orbital elements?
A: They are available at the AMSAT FTP site and home page. During the mission they will be available on the SPRE home page (URL http://w3eax.umd.edu).

Q: Can the SPRE Project tell me what kind of antenna or radio to use?
A: No.

10.0 SPRE PROJECT

Participating stations should contact the SPRE Project so that we can try to keep you updated on any changes. Send electronic mail (e-mail) to Ken McCaughey at kenneth@w3eax.umd.edu.

SPRE Home Page: URL http://w3eax.umd.edu
Anon. FTP site: URL ftp://w3eax.umd.edu/pub/spre

I find it incredible that, as old as packet radio is now, that there's still tremendous technical resistance to this issue of authenticity. About the first time I ever logged on to a packet BBS, I became aware that there could never be any security or a "paper trail" unless the BBS operator could positively authenticate the message or file uploader.

I would think the FCC would be delighted if they could positively trace the origin of certain traffic.

I've read of several schemes and have discussed it with some talented people. It boils down to this: it requires some smarts in the user's TNC and attached computer. That spells chaos, not only for the TNC firmware developers, but also for the software talking to the TNC. It can be done, but not easily. Authentication would have to take place at connection (or reconnection) time. PGP-type clear signed text might have to be implemented also to ensure the contents can't be changed even by the sysops.

Robbert: Sorry for all the poorly done quoting of your/Tim/s text...
Unfortunately, I don't know what UltraPak is/does.

The WA8DED firmware (commanded to be in "host" mode) requires the
terminal program to poll. There are commands to get status, to read a
frame, to write a frame, change logical channels, etc. However, Ron's
host mode emulator, to my knowledge, was never released to the public
domain. The AX.25 v2 firmware was, however. The interface is well
documented and is part of the firmware distribution. Everything should
be available at the TAPR ftp site, among others.

Source record: 39505

Hi,
I have been setting up my linux system to work accross the local
2m TCP/IP network. Most other people around here are using JNOS on the
PC, most things work fine but when they telnet into my Linux system
there terminal setting seems to be wrong as most of the time the first
character of each line is missing. I have tried setting several
different terminal types on login, but they all seem to do the same
thing.

Has anyone else had the same problem ??

Does anyone know of a way around it ? or what terminal type to use ?

Any help would be much appreciated.

Fiends,

A couple of weeks ago I offered a Database program of Broadcast Radio Stations - mainly on shortwave - which was only a DEMO. That program would only accept up to 100 records unfortunately. If you would like a simular program that will accept an unlimited number of records
and already has over 4,000 records now, please respond to this message.

I must register and keep track of whomever has received this program, so would you include your
name and mailing address with your request? This information will be dkept confidential.

Hope to hear from you...

Chuck

I have a Kantronics KAM Plus all-mode TNC with version 7.1 ROM for sale.

Works just fine; just not interested in digital modes any more. Bought new this year. With all cables, manuals, orig. packaging, etc. VHF cable presently is set up for HTX-202.

Asking $225.00; will consider trade for 28.8 modem or 32 bit wavetable sound card.

>The only things I have found are prohibitively expensive..

>Any ideas appreciated - Thanks!

If the IR imagery you refer to is that from low level weather satellites, this information is broadcast on the VHF bands and can be received and displayed on relatively inexpensive equipment interfaced with a PC. The satellites are only up about 400 miles and the signals are fairly strong. No need for dishes as you would need for picking up a geostationary bird. Check out the ham magazines for ads. No need for packet connections for this information.

Regards.

Source record: 39512

Hi !

I am completely new to this area. I am thinking about setting up a tcp/ip or ipx connection between two computers that are only about half a mile apart. I have no idea what hardware I would need. I gather that I would have to buy two radios. ok. But what hardware for the computers ? Is there a document available somewhere that discusses some possibilities including www addresses of retailers ? Preferably, we would want a connection >=14400 baud. Both computers have ethernet cards but no ethernet/tcpip connection. Is there hardware that plugs into the BNC socket of the ethernet card ? Is this a silly question or a bad idea ?

What do people generally use ? Hardware that plugs into a COM port ?

I searched the web for most of the night but couldn't find any sites on the hardware subject.

Any help is appreciated. Please mail personally to atmpj@sable.ox.ac.uk. Thank you.

Peter

All parameter commands to mfj tncs have to have the beginning of "param xxxxxx" for what ever the parameter is. such as txd 33 persist 33 slots 2 or any of the other parameters involved. Due a "Disply" when in native mode and note the parameter setting and command word, use them to set the params in kiss. Also, an observation, the tnc will reset itself in kiss mode in periods of inactivity and it tends to return the paramters to default. You will see the STA and CON leds blink three times in succession indicating this. I have had a 1278 for 4 years now. It makes a darn good multi-mode machine and native packet personal mailbox, but for kiss work I switched to the Tiny 2 as it has a more stable kiss environment.

Hello,

ea4abb@linux.ea4abb.ampr.ORG (Roberto Munoz) wrote :

> What is PC/FLEXNET ???

PC/FlexNet is the PC version of RMNC/FlexNet (RMNC & PC being the hardware, FlexNet the software).

The real question is: what is FlexNet ? It is a digipeater with dynamic links. Eg : if a radio link breaks down, an alternate route is created very quickly (if your network is correctly built of course :-)), without any human help

Concerning the hardware, PC/FlexNet can use many interfaces :

. BayCom serial 1200 Baud modem
. BayCom LPT 9600 Baud FSK modem
. BayCom USCC cards (2, 4, or 8 channels)
. TNC-2 and compatibles within a kind of a token-ring network (using the 6PACK driver)
. Ethernet cards
. KISS protocol on COM ports
. Sound Blaster cards (I don't know if the driver has been updated for the latest version, but it used to exist :-)).
. Texas Instrument DSP Starter Kit (idem above)
. Vanessa cards (kind of TNCs, built in the PC, made in Switzerland)

Turbo-C & Turbo-Pascal developer's kits are available for programers : you can invent any applications you want/need (eg: Dx-Node, BBS, Weather Node, etc...). A non-official English version (home made) is available under Word 6 format, dealing with PC/FlexNet only, as well as an official documentation dealing with FlexNet commands (ask DK7WJ @ DB0GV).

If some readers are interested, please fell free to contact Gunter, DK7WJ @ DB0GV, or to send me an email (ftp is possible to get the files if needed).

>(from NTK?). It's not something that's carried by DigiKey, Allied or
>Newark. Any ideas?
>
>73..Jim N2VNO
>

Try the SFG-B or SFH-B series from Murata The important part is the SF which designates the low group delay. THe G designates 4 element 3 lead and the H 6 elements and 5 leads. They come in either 450 or 455 center freq. The B is the widest bandwidth. I use the SFG455B with good bandwidth. I assume you are trying 9600BPS?

Give Allied a try again but have them search their database. They are a part of Avnet and I get my parts through them for work. Problem is that these are on the slow boat from Japan and on allocation. I cant' get them fast. Try HA direct at (716) 475-9130. If you just need a few I might be able to get you some because you're local.

: <DELETED - Basic idea was:
: How can I link my repeaters using the Internet?>

I like the general idea... The implementation may be interesting,
tho... To get good quality, you'd need *AT LEAST* a 64k ISDN line,
and preferably more, to each site being linked. Otherwise, your audio
quality would not be good. Using that as a guide, I will now outline
an idea running thru my head!

What I would suggest is a STAR type network topology. (central hub
point with multiple "client" sites.) Station a 386 Linux box at each
client site, and a SPARC workstation at the main Hub site. You could
then use MBONE type technology for this, or write your own... I'd be
interested in helping...

46. FS: TI C5x DSP Starter Kits (DSKs)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-03 00:00:00 UTC
From: cole@netcom.com
Message-ID: <coleDKL9LC.I90@netcom.com>
Source record: 39526
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I have several TI 320C5x DSKs (DSP Starter Kits) for sale. The TI part number is TMDS3200051. They are all brand new and have never been opened.

These kits are designed for students, experimenters, and developers who need a simple, low-cost way to prototype DSP-based applications for the TI 320C5x series of DSP chips. The kit includes a small (2.5" x 4") PC board with a TMS320C50 processor, a TI Analog Interface Circuit (AIC) chip with 14-bit A/D and D/A capable of sample rates to 19.2 K samples/sec, RCA jacks for analog I/O, and a 9-pin RS-232 host interface. The kit also includes a simple assembler, loader and debugger for the PC, a kit manual and a TMS320C5x manual.

The latest versions of the software as well as several user-written demo programs can be downloaded from the TI BBS, accessible via TI's FTP host ftp.ti.com, in directory /mirrors/tms320bbs. The board requires a 9 volt *AC* power supply capable of >250 ma. A 9 VAC 780 ma supply with the right plug is available for $8.99 from Radio Shack (Part # 273-1630).

TI sells these through distributors for $99, and purchasing them through distributors can be a hassle. I'll sell them for $60 each shipped within the US. Terms: Price is firm. The units are guaranteed against DOA. Immediate shipment if payment is by USPS or other money order or cashier's check. Personal checks are OK but I'll wait for them to clear. No CODs, please.

>I find it incredible that, as old as packet radio is now, that there's
>still tremendous technical resistance to this issue of authenticity.

Simply put, the spectre of 10 years/$100,000 for using a false
callsign doesn't scare anyone enough to prevent it from occuring.

Demands for additional authentication are a tacit acknowledgement of
this fact.

Encryption for authentication is legal in the USA. Hams using real
computers for their packet communications could begin using it in short
order. TNC/dumbterm stations could use one of the one-time-pad, S/Key,
or equivalent mechanisms. Some BBS software packages already have it.

The technology is simple. All we need is to want it enough to do it.

Never happen.
- Brian

The B types can do 19200 bps without problems, and 38400 bps with a
slightly degraded eye.
For 9600 bps, the D type should be wide enough.

There are different ways of approaching it. For PGP signed cleartext
you don't need support in the TNC or the software talking to it.
It would only be more convenient to have some way of preparing a signed
message without leaving the packet software, but a reasonable OS would
allow that anyway.

Authentication of the connection itself is another thing. It is more
difficult, for the reason you give. It would have the advantage of solving
all problems in one go.

==========

Mike,

If you want to advertise a piece of ham equipment for sale, I would
suggest that you use the "rec.radio.amateur.equipment " usenet
newsgroup.

If you would like to do some plain old ham operating using the
internet as a replacement for a TNC, drop me a note and I will tell
you how to use a gateway via telnet. I do it all the time. There are
usually 50-100 hams online 24 hours a day and they are literally from
all over the world.

Also you could use the #hamradio IRC chat group to get info. There are
usually a few hams there and they are from all over the world, but
they are all using their computers and the Internet -- not their
radio/TNC equipment. On the gateway, they are almost all using their
radio equipment, and most of them are not even aware that they are
going out on the Internet.

Good luck,

Les Goins - K5HR

I would like to correspond with anyone who is interested in developing a QRP-ish (1-5 watt output) spread-spectrum modulated transceiver or, if you like, to discuss general SS/DSP issues, please leave me a note.

If anyone knows of a SS QRP kit available, please let me know. I would like to work the PANSAT satellite being developed by the Naval Postgraduate school.

Should work quite happily - what doesn't work? I think it will work with TXD, RXD and GND (TX and RX crossed of course) if you set FULLDUP=1 on the relevant port. You can use KISS (unpolled) or NETROM options, although I think NETROM is preferred because it is checksummed. You can add in the handshake lines and diode matrix as per TNC2 node clusters if you want more than two machines linked.

FWIW I gave up using serial ports when I picked up a couple of network cards cheaply. The system seems to works better with an ethernet link, possibly because it has less interrupt overhead.

I even gave up using network cards when I gave up running the BBS last year.....

> If you had any success in this area please let me know.

When I was running a packet BBS some years ago I had a couple of PCs
running BPQ, linked together via the serial ports, without any problems.
I checked with John Wiseman (Mr BPQ) first, and he told me that he
debugged his software this way. I was using the second machine to
monitor what was going on on the BBS from another part of the house.

Sure. Define an ASYNC port to run KISS protocol on each PC, then connect them together with a serial cable. You'll probably have to use a "null modem" cable, or build one yourself. I'm using a 3-wire cable here with each PC's receive line connected to the other PC's transmit line.

I can vouch for this configuration. I'm using it at work. Since I am
not the only ham who uses it, we modified our personal minicom startup
script to set mycall to our call signs. You just can't do file
transfers.

Hams don't seem as free about source code as Internet programmers. If
there were some file transfer protocol code out there publicly
accessible, it should be fairly trivial to add it to minicom's
menu of protocols.

>
>ZR6SKY @ ZS0ABN.TVL.ZAF.AF
>

It is easy to link two computer under BPQ ! Use a 3-wire (7 will be
better) cable. Following is the shematic connexion for the 3-wire cable :
2 <----> 3
3 <----> 2
7 <----> 7
This is for a 25 pins SUB/d connector.

Dont forget to add a new PORT configuration on BPQCFG.TXT.

Thats all.

A such system is running here with a FlexNet node connected to a computer
(with BPQ + FBB) and next a second computer (with BPQ + DxCluster).

Hope this will help you.

Hello roger,

I've had a MFJ 1278B for about a year now and the SSTV
function has never worked. I have made several calls to MFJ and
their answer was to send me a new copy of the Multicom software.
Well, I have 5 copies of the software and the SSTV still doesn,t
work .I've came to the conclusion that MFJ doesn't know how
to fix the problem. I know of another ham that has his SSTV work
to some extent but always has to exit the program for it to display
the picture. If you get one that works I would like to know about it.

: Try the newer rigs, for example the Kenwoods, which have a suitable
: socket on the back. Ask your local ham shop for details of which are
: fitted with such. I think most rigs are suitable equiped now, apart from
: handies.

I agree. I have the Kenwood TM-251A. It is a nice little rig, has
extended receive (118.0 - 173.995), tone encoder, etc. It is
'supposed' to be 9600 ready, but most of the commerical rigs still
have some problems with that. The data port on the back is a
'mini-din' plug, so if you're interested in packet, buy the data
cable with it.

It was about two weeks before I could say that I had 'mastered'
all of the features. It has two different menus in it to set
such things as display brightness, tone alert, scan limits, etc.

The three power levels are 5, 10, & 50 watts (advertised), but
mine runs about 5, 10, & 40. Current drain is about 11 amps, so
get a good power supply. All-in-all, I like it, and if pressed,
would probably buy another one. It was a little pricey, but
aren't they all these days if you're looking at new.

Hope this helps.

Source record: 39541

Well, there really isn't much you CAN do once you connect to a
local packet node unless you are in an extremely rare area. I
speak as a longtime packet aficianado, compared to internet
packet is KINDA clunky and limited.
However, once connected to a node, Try:
-Send a U (for users) command. Most systems will respond with
a list of current users. Most calls with a suffix of -15 etc
are merely bbs through-users or other nodes passing data thru.
If you find a really ham-looking call, such as W5XY, try
sending the command C W5XY which will tell the node to try
connecting you through to him.
-Send an H (some systems use J) command (for stations Heard).
Calls showing up in this list may still be on the air and you
can, again, issue the C W5XXX command to tell the node to
attempt connecting to him/them.
-In more packet-active areas you may find such interesting
things as DXclusters, bbs's with callbook lookups etc on them
(again, bbs's only have a sampling of what's available at much
higher speed with less stress on Internet circuits).
DXclusters allow you to connect to a network of similar nuts
that allow you to work DX, type in the freq and call and other
info, and it bleeps to all other connected parties in the
system for them to join the pileups, as well as providing YOU
with similar current activity on the bands.
You can also send a ? to most nodes which will usually result
in a command list being returned. You can always do the newbie
thing of sending a R or N (Routes list or Nodes list) which
results usually in a TREMENDOUS jamup of the channel as the
node attempts to transmit every known node in its memory to
you. On quiet channels and in lesser populous areas you can
use R and N to hack your way around the country to nodes far
away... but most of us quickly tire of the resulting looooooong
waits and delays and those of us with internet access don't
even try it anymore.
Packet CAN be useful and interesting, some of my favorites are
remote controlling devices such as remote bases, beacons,
weather stations, etc.

79. K102D Logic Analyzer

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-05 00:00:00 UTC
From: "Walt W.", dfheli@Gramercy.ios.com
Message-ID: <4chvnr$5d0@news2.ios.com>
Source record: 39459

Greetings All,

I have a Gould/Biomation K-102D Logic Analyzer for sale or trade.

The machine works.

I made a travel case for the unit, pods and schematics. Recently
that case was stolen from my car, and so were the pods.

I am asking $500 for the analyzer, or trade for something?

regards,
walt williams, 96.01.04

Gidday,

I run 2 computers here, side by side. Computer 1 runs FBB515c along with BPQ408 to 2 DRSI cards and an RS-232 link to computer 2 running TPK with a virtual TNC courtesy of BPQ408a. TPK is running fine with BPQ in their own DOS window under windows 95, which allows me to access internet, run a dummy copy of FBB515c (not connected to anything) as well as do 1 or 3 other things as the mood strikes me.

There is no problems just connect it up with a null modem cable - and it works. Got to remember of course to set up the unproto broadcast function on the BBS (computer 1) to get the message header lists on TPK (on computer 2). I run the link at 19k2 baud. Just a tad faster than standard 1200 baud packet

81. Need Help with KAM Lockup.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-05 00:00:00 UTC
From: ppiercey@nlnet.nf.ca
Message-ID: <4cjnfm$2b4_001@vo1he.ampr.org>
Source record: 39461

Hi All,

I run a local BBS in St. John's, NF and I am having some trouble with the KAM used for the VHF/HF ports. Until recently, it ran fine with both JNOS and now FBB/BPQ but it seems to lock up regularly. Being at a remote site, it isn't too much joy to have to make trips there to reset the TNC. As far as physical location, it is sitting on top of a Kenwood TS-450, which is next to the computer. It has a KPC-9612 on top of it, which has no trouble. Could it be stray RF or a problem with the KAM itself?? Like I said, it ran fine until recently. If anyone has had a similar experience or knows why this is happening and has some info on fixing it, please contact me directly at my EMail address below. Thanks.

>> Hi, I am wondering if anyone has tried connecting the RS HTX-212
>> mobile to a KPC-3. If so how did this work out,

I have just started to do this and I am goingto use a MFJ1272???
mic/tnc switch as it already has the RJ-45 phone type cable.

I also picked up a RJ-45 cable to use for quick testing.
I pland to start by using a drawing in a AEA TNC manual.

The audio in to the TNC will be via the exteranl speaker jack.

I will report on progress

Someone recently asked about a mod that allows use of the narrow cw filter on rtty. I just called Yaesu tech support and thy had not heard of any -factory authorized- mod.

Maybe someone has done it themselves. If so please share ;-)

Kantronics hasn't released that code into the public domain, but they'll
sell you a new programmed EPROM for a reasonable sum.

93. Heath Pocket Packet (HK-21) and PTT

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-05 00:00:00 UTC
From: little@pecan.enet.dec.com
Message-ID: <4ck6t5$usn@usenet.pa.dec.com>
Source record: 39473

I'm having difficulty with some of my rigs and the HK-21's PTT handling. In particular it won't key some rigs at all (Midland 13-509), keys some rigs all the time (Yaesu FT-736R), and works perfectly with others (Yaesu FT-726R). I am using the RJ-11 (or whatever that size connector is called as it is smaller than a standard RJ-11, as in the size of a handset connector) connector. I have zilch in the way of documentation and would appreciate any suggestions before I start trying to trace out the PTT circuit by hand.

73,
Todd
N9MWB

94. TimeWave DSP599ZX or MFJ-784B

Hi.
I am interested in the above DSP units for an addition to
my ham shack. I would be interested in hearing from anyone
with experience in using any one of the above units, or
anyone who has compared the two units, or has information on
them, which one is recommended.

Thanks
Sean McDonald

> suggestions?
My experience was very similar. I've checked and rechecked the
interface, and am convinced it's working properly, since I can decode
packets with pktmon, another software package designed around the
interface. Is it possible that there are bugs in the decoding routines
in version 3 of the Hamcomm software? Or is it possible this is an
artifact of my '386SX16? It would really be helpful to hear from
anyone who has successfully implemented HamComm.

Hello Paul,

In article <4cjnfm$2b4_001@vo1he.ampr.org>, ppiercey@nlnet.nf.ca says...
>recently, it ran fine with both JNOS and now FBB/BPQ but it
>seems to lock up regularly. Being at a remote site, it isn't

Sounds like it could be one of two problems. The first wound be that your RFIing the TNC or RS-232 line to it. The second would be that the com port card is starting to go bad. This could also lock up the TNC.

On the first, space permitting try to move the KAM away from the rf producing sources. You may have to shorten up your RS232 lines and use shielded cabling with only one end grounded. This will help prevent a RF loop in your system. You may also have to wrap the cable in a torroid and try to us it as a RF choke.

One the second, This would be a simple installation of a new comm card or trying a different port and IRQ.

Since your running JNOS, check to see if you have the 'at', 'remote' and 'shell' commands compiled in. With these you can setup a sequence of remote commands that could do a TNC reset and restart JNOS from one of the working ports. I use the remote and at commands to reset the LANs main systems once a day. This has been a great way to keep things up and running for long periods at the remote sites.
Hope that this helps out.....
Michael

HELLO FELLOW HAMS:and FUTURE HAMS !!!!!!!

HAM BBS dedicated to amateur radio !!!!

There is a DEVOTED AMATEUR RADIO BBS in town ,from your
ARRL/LAX affiliated club coordinator , JOE CIRA , KB6AXK ....
Everything and anything about AMATEUR RADIO will be found here,
IF NOT ? Let me know and we will post it and file it !!!!!!!!

HAM*INFO*LINK*SOURCE BBS at 1-818-584-1952....
24 hrs,8-n-1,anyspeed.......
running 486/66 with 2.1 gig of space !!!
cd/rom's soon and TNC/PACKET DOOR IS UP & RUNNING !!!
qsl route database,clubs,newsletters,bulletins,shareware,utility
mods,programs,test ques,lists,software and much more....
VEC/VE exam & class list for all So.Cal.
sample exam tests and answers for all class's..
ARRL mirror of all there files !
Using Wildcat v4.11 software..
easy to log in and no FEE's it's FREE !
5,800 FILES IN 115 FILE AREA'S..so far !
GOOD NEWS THE LANDLINE TO HAM PACKET DOOR IS UP AND RUNNING*******
ARE YOU ON THE HAM USERS LIST ???????

99. Mac Packet software - where?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-06 00:00:00 UTC
From: Kevin Sweere <kesweere@mtu.edu>
Message-ID: <4cmf9g$92p@news.mtu.edu>
Source record: 39478

Hello,

I'm just getting into packet after 2m'in for 4 years. I'm looking for software to run my TNC. I have a Mac Powerbook PowerPC so I can run PPC, Mac, Windows & DOS software. I prefer to run native PPC software. What (of all the apps) is best of which of the Mac apps do you reccommend?

Where can I find it - an alt.binaries newsgroup or a ftp site?

Kevin Sweere

Hi all,

My company now has a few pages of amateur radio kits
on the WWW - The address is
http://ourworld.compuserve.com/homepages/drcp

the kits (and forthcoming projects) are mainly for
CW - they are PIC processor based -
a complete Iambic keyer on a 1 inch PCB
a complter morse tutor on a 1 inch PCB
are currently available...
and other kits will be following soon...

have a wander and enjoy... comments please...

>--
>Jeff McLeman jeff.mcleman@airdata.com

No, dont use a quad or a beam. You're real problem is the low power.
On packet, its not just the BBS that cant hear you, its EVERBODY
else on the frequency. Even if you are a block away from the BBS,
all the other packet stations need to hear you. If they don't, they
will be transmitting at the same time. This is a packet collision.
The BBS cant make out anything, and you (and EVERBODY ELSE) will be
retrying like crazy. It only takes one HT to fuck up an entire
packet BBS for everyone. So, using a beam or quad will prevent the guys
off to the sides from hearing you also. So this is a bad thing.
The rule for good packet, is for all stations to use an omni antenna
up as high as possible, and run as much power as possible.
Of course, if you live on an ocean shore, you dont need to worry
guys behind you.
I use my icom 229 in 50 watt mode into a 5/8 verticle up 30
feet, and it works great till after Christmas when all the
new guys put their new TNCs on the air into their new 202s.
So, try to be a good citizen, and do whats best for everyone, not
what's best for only you. OK? -pat

> directly from the radio to the TNC? Thanks.
>
> --Mistie I don't know the connection for the HTX-212 but I am sure it can
be done and work very well for 1200 baud packet. You might look at
the packet connection home page at www.idir.net/~medcalf/ztx/wire/
I just looked and right now they dont have the HTX-212 listed but it is
almost certainly identical to some other model radio for which there is
a diagram.

Also for those recent enquiries about hooking tnc's to HTX-202 HT's
the pictorial diagrams are listed here.

Because it is better to use an omni antenna on a CSMA packet channel.

109. AEA PM-1 - Info Please?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-06 00:00:00 UTC
From: acopac@hope.netwizards.net
Message-ID: <4clunn$fa1@news.wco.com>
Source record: 39488

I have an AEA PM-1 packet modem and need the manuals, if necessary
software for same. A call to AEA resulted in "I don't recognize the
model number" ...

Interesting Idea - However given the snails pace of the net for the
last few days...and actual crashes..do you think its practical for all
but control?

I purchased a mfj data radio yesterday and can't get it to operate correctley. I made a cable to connect it to the kpc3 and it transmits, but I can't get it to receive. I am unsure of some aspects of the set up. What should the baud rate be set at for the tnc. the mfj comes set at 1200 but the kpc3 won't sign on unless it is set to 9600. if any one has experence with this combination could they please respond to this message.

> up as high as possible, and run as much power as possible.

Close. Run as much power as necessary. Unless you live in the boonies
and there are no other PBBS or other nodes on the frequency, you
will just interfere with more distant PBBS by running excess power.
Necessary power in this case should be enough power to hit all stations
that are in the PBBS normal user area. Any more power is both unneeded
and of course against FCC rules.

That is one of the biggest problems with packet networks. There
needs to be more use of packet repeaters (not digipeaters) then
all stations hear all stations and the hidden transmitter are
eliminated.

114. Wanted: KPC-1 v2.70 EPROM image needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-07 00:00:00 UTC
From: djbeck@mmm.com
Message-ID: <djbeck-0701960056130001@djbmac.mmm.com>
Source record: 39394

Greetings,
I am asking for help. I have a Kantronics Packet Communicator model KPC-1 (ROM version 1.6). And I received information to update the hardware to version 2.70 from them.

They used to provide an update kit but had so few requests for the kit that they discontinued the kit. Their tech support was very helpful in locating and FAXing to me the instructions for the hardware update which I've completed.

The update kit used to contain:
1. New program EPROM (U4)
2. New EEPROM to replace the NOVRAM in versions 1.5 or 1.6
3. New RAM (U6)

What I need/request is for anyone who has an upgraded KPC-1 who would be willing/able to send me the EPROM image.

Thank you for your assistance.

```
#This file contains the latest PBBS, tcpip switch, full time Nodes and YCCC
#packet user's frequencies on 2 meters in the New England area. Please let me
#know of any proposed changes or corrections so the list remains current.
#This file can also be used as a data file for the PLANnn.EXE and PLNGRFnn.EXE
#programs which are available for FTP in zipped form from the public directory
#on switch.bedford in Bedford, MA. PLNGRFnn.exe is now truely generic - it can
#be used for any location for which there is a APRS map available.
#The latest version is 37 and displays lighthouses too!
#I will also return copies of both programs upon receipt of a formatted disk
#and SASE. [Standard envelope is ok for 3.5 inch disk.]
# D.G.Willard, W1EO
# 39 Long Ridge Road
# Carlisle, MA 01741
#This list is dated 26 December 1995.

116. Icom W2A to TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-07 00:00:00 UTC
From: 72737.157@compuserve.com
Message-ID: <4cn8dk$q7u@dub-news-svc-3.compuserve.com>
Source record: 39396

How can I connect a TNC to an ICOM W2A handheld? It seems the speaker mike connection is a stereo jack through which goes ptt, rcvr audio and tx audio.

121. SPG-NEWS for Windows

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-07 00:00:00 UTC
From: kizawa@mb.infoweb.or.jp
Message-ID: <4coct5$1uq@news.infoweb.or.jp>
Source record: 39401

Hello.
Thank you very much for having my message read.
I will introduce the software which I developed today.
Packet radio network correspondence e-mail system SPG-NEWS for Windows was developed this time.
SPG-NEWS is e-mail software characterized in the operation environment by GUI.
Each other of FWD-RBBS and the message of W0RLI and the F6FBB type is forwarded.
There are two kinds of communication methods of the following.

1.Method of exchanging message according to forwarding protocol
2.Auto-pilot function to connect automatically at reserved time, to read message and mail of specified genre, and to transmit message which I wrote.

The operation environment is Windows3.1 or Windows95.

The beta test is done to the fourth edition of a Japanese version in Japan now. The fourth edition (Japanese version) schedules formal release in the first quarter of 1996. An English version is scheduled to be released from the Japanese version release within three months. :-)

The home page of SPG-NEWS was established in undermentioned URL.
Please see by all means.
Japanese version SPG-NEWS can be down-loaded on this home page.

From: moorepa@wkuvx1.wku.edu
Message-ID: <1996Jan7.134639.1@netnews.wku.edu>
Source record: 39402

gosh it sounds like at least 3 of us in the same boat - i
just downloaded a copy of 3.0 and built the interface - it
decodes cw just fine but absolutely no intellegence on rtty
just as u folks mentioned - transmit audio is just fine as
well as ptt circuitry - im using an old xt clone 10mhz and
i blamed it on that, as the hamcom manual sez on page 3 "on slow
systems, e.g. 8088 cpu, some functions may not work as expected
or may not work at all" - i blamed the lack of rtty decode on
my antique confuser, but luks like it is a problem on fast, new
generation confusers too? anyone tried the older 2.x version?
my buddy has it on cd rom so maybe i can get a copy from him and
try it out - will follow up - i learned of hamcom from w4vzr/7
while working him with a borrowed mfj1278 so i will try to get
ahold of ron and see hw he made his run - someone pse HELP and
tnx, 73

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-07 00:00:00 UTC
From: moorepa@wkuvx1.wku.edu
Message-ID: <1996Jan7.135431.1@netnews.wku.edu>
Source record: 39403

Last night I downloaded a copy of Hamcomm version 2.2 and tried it - the interface schematic is the same. RTTY copy was unintelligible until I hit the tab key to reverse - I was listening on 20 meters. Then, I was able to copy occasional words and callsigns, but nothing like a complete transmission. Copy improved when I cranked the audio gain on the TS-440 to near max, but still not the the point where I could call it usable. I'm beginning to suspect that the 741 op amp doesnt' have enough gain in this application.
We (now three of us - follow the thread backwards) need more information - has anyone else tried HamComm? Has anyone gotten it to work? Does anyone have any other non-TNC solutions to copying teletype that don't involve motors and oil-dripping machinery?

>Necessary power in this case should be enough power to hit all stations
>that are in the PBBS normal user area. Any more power is both unneeded
>and of course against FCC rules.
>Todd N9MWB

Todd, where I live, there are guys 40 miles away coming into our BBS.
Yet some people 20 miles away are using one in the other direction.
They all need to hear my station. These guys in the middle, hitting
the "more distant PBBS" need to hear me so we don't collide. And,
that PBBS needs to hear me also. Otherwise he and I collide, and his
users suffer.
So I think thats its difficult to say what "necessary power" really
is. As we decrease power, we create a larger set of distant stations
that we collide with. As we increase power, we slow down the frequency
by having so many stations all waiting. So, my opinion is, that
"necessary power" is fairly indeterminate.
FCC rules only speak of using enough power to carry on a QSO with
the other station, they dont talk of necessary power for dozens of
other guys to hear you.

: 73 de AL7L

i have downloaded 2.2 and 3.0 and am having the same problems
as u fellows - i have once copied a cq and never anything else
everything luks rite on the tune/spectrum displays - interface
checks out ok, in fact it does a terrific job decoding cw and
works quite well on all phases of xmit - i mite add im using
an 8088 xt clone and blamed it on the slow clock speed as docs
indicate that some functions may not work correctly or at all
on older 8088 slow machines - al7l sez he is running on 386sx16
and it wont decode there either - i learned of hamcomm from
w4vzr/7, ron in arizona - he had it running and we had no
problem having a qso - what gives? - any help? - sure wud like
to get it working and i wud certainly register it - great way
to get on the digital modes - 73 and tnx to all

Subject: Which Jack for HF Radio-to-TNC Cables? (new article)
Newsgoups:

Many HF radios have more than one jack that can be used to cable the radio to the TNC. How do you decide which one to use? The article "Which Jack for HF Radio-to-TNC Cables?" describes the transmit methods (AFSK, FSK, CW), and things to consider for each jack.

Article URL: http://www.idir.net/~medcalf/ztx/hf2tnc.html

From the home page at http://www.idir.net/~medcalf/ztx/ you can link to other articles, including one with sound files of the TOR modes. The articles may be reprinted in amateur radio club newsletters provided that credit is given to the author.

The site also contains diagrams for wiring radios to tncs.

132. Re: 9600 baud mods ? (tr-751/ic275a)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-07 00:00:00 UTC
From: Jeff Goebel <jgoebel@rrnet.com>
Message-ID: <4cpjch$9kl@news.rrnet.com>
Source record: 39412

I have successfully modified my TR-751 for 9600 baud use, relatively easy and leaves the rig usable for voice and 1200 baud use as well. It works great with the KPC-9612.

You can find info in the following document:

ftp://hydra.carleton.ca/pub/hamradio/packet/96man2x0.txt

Both connections are accessable by removing the bottom cover of the radio and are located on the main board. I just used the IC-2 pin 9 RX (to pin 2 on the 9612's 9600 baud port) and D-21 cathode TX (to pin 3 on the 9612's 9600 baud port) (D-21 was a flat surface mount diode and I soldered directly onto the Cathode side) I found it necessary to put a switch in the line to use the radio for voice when connected to the KPC-9612. Otherwise, I had no transmit audio.

From: bad@wpi.edu
Message-ID: <4cpqf0$3r2@bigboote.WPI.EDU>
Source record: 39414

Selling:

NE2000 compatible 16 Bit ISA network card,
has BNC connector for cheapernet, and a AUI port for plugging in a 10 base 5 or 10 base T transceiver. Card is not auto-sensing - you need to switch jumpers in order to switch it from the AUI port to the BNC port and vice a versa. Have all the documentation, original box, and test program disk (although you shouldn't need it, it's a hardware programmable card).

I am currently using this card on my secondary Linux server, and have a 10 base T transceiver plugged into this card's AUI port, and connected to my primary Linux server with cross-over 10 BASE T wiring (no hub).

Asking $50. You can see it working if you drive to my place in Grafton, or if you live near WPI we could test it in your machine (if you so desire).

Questions/Offers please send me email at: bad@wireless.wdc.net

Ham radio style 9600 half-duplex packet is a bit slow for Web stuff,
but i guess you could try it. Obviously you can't connect to
commercial servers over the air on the amateur bands but other than
that it should be pretty simple.

I get on amprnet via the tnc's by using a NOS program running on a 286
to do the ax25 and tnc interface. Then my windoze box is connected to
the 286 via ethernet. This allows me to use all the windoze
applications over the air. Pretty simple setup and less complicated
than trying to find ax25 drivers for winsock tcp stacks.

I've been thinking about putting up a limited web server for amprnet
here but the speed of the networks don't make it very practical.

I have used Hamcomm 3.0 extensivly, even ran on contests with it. Be sure you have the mark-space relationship set correctly first. If that is correct then be sure you have taken the time to go and set the ticker value in the configuration file. The docs say that this is necessary for TOR but I think RTTY may be affected too. Be sure you are not over or underdriving the audio into the interface too. I now run a KAM cause I wanted Pactor/GTOR/VHF packet but I still use Hamcomm from time to time when I am out camping. It is a remarkable piece of SW.

From: craigs@ti.com
Message-ID: <4cre2o$eiv@superb.csc.ti.com>
Source record: 39421

The HamCom '96 amateur radio convention is expanding its focus this year, with a theme of "Computers, Satellites, and Microwaves in Today's Amateur Radio" and is looking for speakers who can address these topics. Of particular interest are programs which bridge these topics (High speed packet on the microwave bands, packet operation via satellite, etc.). Speaker sessions are typically 20 to 30 minutes in length. HamCom '96 runs Friday, Saturday, and Sunday, June 7 - 9, with speaker's forums all day Saturday and morning on Sunday.

If you are interested in speaking at HamCom '96, or have suggestions for speakers, please contact me at email address craigs@ti.com, or via phone at (214) 952-4616.

Hi there,
In article <4cqinq$3kpm@news-s01.ny.us.ibm.net>, herksen@ibm.net says...

>I am currently using a program called GRAPHIC PACKET.
>It runs under DOS on my 286 LAPTOP and I like it.
Which Version do you use? Current are 1.61b (DOS) and 1.01 (OS/2)
>When you log into a (packet) BBS, and list all the messages, GP is
supposed
>to record all those header lines, and save them in a special window.
>
>Well, this particlar feature NEVER worked for me.
This does not work with every BBS-System. I know it works with
BayBox (from BayCom-Group), and DieBox (by NordLink). I think FBB
should work also, but i can`t check it.

>It was a message from a norwegian ...
> and when I looked in the BBS window, I had actually recorded all
>the message headers from the Norwegian sysop message.
Maybe they use a System like DieBox ?

I have the same setup and it works very well. RJ45 connector on radio
to db9 on kpc3. tnc is seeing audio loop though due to design of
htx212 and I see my tx packets as well as rx, annoying but does not
affect functionality...

Hi John! John Hansen post a very interesting message regarding part 15 spread spectrum, 3MB communications between 2400 and 2450 MHz. John, I have no comments regarding your questions but rather a friendly reminder that the first few MHz of 2400 is now occupied by amateur satellite downlinks that are indeed very very weak signal. It now appears that there is a collision course being proposed in the narrow spectrum that gives many of us concern. Your ability to possibly smooth this concern would be very much appreciated. ) Todd, where I live, there are guys 40 miles away coming into our BBS.
)Yet some people 20 miles away are using one in the other direction.
)They all need to hear my station. These guys in the middle, hitting
)the "more distant PBBS" need to hear me so we don't collide. And,
)that PBBS needs to hear me also. Otherwise he and I collide, and his
)users suffer.
) So I think thats its difficult to say what "necessary power" really
)is. As we decrease power, we create a larger set of distant stations
)that we collide with. As we increase power, we slow down the frequency
)by having so many stations all waiting. So, my opinion is, that
)"necessary power" is fairly indeterminate.
) FCC rules only speak of using enough power to carry on a QSO with
)the other station, they dont talk of necessary power for dozens of
)other guys to hear you.
)-pat

Since nobody's mentioned it yet... A MUCH better solution to this problem
is the use of full duplex packet repeaters. We have one locally running
9600 BPS TCP/IP, but there's no reason it should be limited to any one
encapsulation. I'd like to see the packetcluster nodes, PBBSs, etc. use
more full duplex access ports.

It does cost more to set up the user port, however the payback is that each
station ONLY needs to be able to hear the repeater. Very low power can be
used, and a small yagi can be used at any of the stations. Collisions are

at a minimum and effective throughput goes WAY up.

148. High Speed Digital Links Using Part 15 Spread Sprectrum

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-08 00:00:00 UTC
From: "John A. Hansen" <hansen@ait.fredonia.edu>
Message-ID: <30F08AD2.4419@ait.fredonia.edu>
Source record: 39428

Hi Folks,

I'm wondering if anyone else on this newsgroup has been experimenting with part 15 spread spectrum for high speed digital links. The price of this equipment has really come down over the
past year. About two weeks ago I installed a 3 mbit/sec link between my office and my house using Breezecom equipment. I now troll the internet at the full T-1 rate that is available in my
office. The equipment on the office end cost about $1200, but could allow (theoretically) as
many as 64 people to access it. The equipment on my end is on the order of $650. It runs spread
spectrum between 2400 and 2484 Mhz.

The antennas involved are small patch antennas (a la P3d) and I was repeated told by several
companies that they came with "proprietary" connectors so that you could not hook up higher gain
antennas. Imagine my surprise when they showed up and appeared to have standard SMA connectors
on them. BreezeCom is about to start selling a small dish antenna that they claim will extend
the range of their equipment out to 20 miles or so. This raises a number of interesting questions:

1. Given that these are Part 15 devices (no license required) it would seem to me that they could
be used for amateur packet radio backbone purposes. It does not seem to be significantly more
money than many folks are now spending for 19.2 Kbit stuff.

2. I remember back in the days when we were wrestling with the FCC over unattended HF operation,
Phil Karn wondered out loud whether we might be better off packing up packet radio and moving to
the unlicensed band. I wondered at the time if he was serious, but I'm wondering a good deal
less now. Many people in these parts are greatly enjoying keyboard to keyboard QSO's via amateur
gateways to the Internet. The principal reasons they can't get full internet service this way
are A. Amateur Packet is too slow, and B. The Internet involves commercial communication. I don't think that it is beyond the scope of possibility that in some communities it might be worthwhile for a amateur (or other) club to fund one or more access points that it's members

would then use in their homes to access the internet at speeds significantly faster than ISDN.
The rub here, of course, is the cost of the Internet connection from the access point, but still
I wonder if there aren't some possibilities here.

3. As I understand it, the current spread spectrum STA involves frequencies that are substantially lower than this and that the users are pursuing data rates that are substantially
slower than 3 mbit/sec. I wonder if the ARRL's petition now before the FCC will clear the way to
use this commercial equipment with amplifiers in the amateur bands. The unit I am currently using runs 50 milliwatts.

I've posted this article in part to bring this to your attention because the technology is interesting and relevant, but mostly to determine whether anyone else on this group is experimenting with this kind of equipment. I'd like to compare notes on range, operating conditions, antennas, etc. If there is sufficient interest I would be willing to use my server
to host a mailing list devoted to this subject.

Sure. FAX has been around in amateur radio for a very long time.
25 years ago I was doing it with Western Union desk fax machines,
but it's a lot easier now. Some of the commercial multimode
controllers support it, but the easiest way is to get a copy
of JVfax for the PC and build the simple interface it uses.

>Just my two cents, and then some...

Actually, the use of PGP as Authentication is just fine. It's my understanding
that this is what people are doing. The text of the message is in the clear,
but the PGP key added at the end is merely a fingerprint that can be used
to authenticate the origin of the message.

Encryption of content is not allowed under the rules, but authentication,
compression, etc. are all legitimate uses, IMHO.

From: herksen@ibm.net
Message-ID: <4cqinq$3kpm@news-s01.ny.us.ibm.net>
Source record: 39431

Hi there and thanks for reading my message.

I am currently using a program called GRAPHIC PACKET.
It runs under DOS on my 286 LAPTOP and I like it.

When you log into a (packet) BBS, and list all the messages, GP is supposed
to record all those header lines, and save them in a special window.

Well, this particlar feature NEVER worked for me.

Anyone having an idea how I can solve this problem? My home BBS runs FBB
software.

O, one more interesting thing:
One time I read a message from my home packet BBS, and it came from Norway.
It was a message from a norwegian sysop that was complaing about CB-ers using
our packet environment without having a licence.
He included a screendump from his system showing a list of headers.

When the message was scrolling over my screen, suddenly I heard a
beep, and when I looked in the BBS window, I had actually recorded all
the message headers from the Norwegian sysop message.

HELP!!

I'm new to the digital stuff...

Lessee, KPC-3, Hostmaster Mac software.

Monitoring a local packet frequency, which happens to have one station
transmitting regularly.

ID (with some brief data) comes through fine.

A couple times each hour or so, it sends longer message.

Except for some all-caps identifiers, the rest of the data is unreadable,
showing up as collections of non-ASCII characters, such as cedillas,
things with umlauts, etc.

Do I have a problem, or just a flag set wrong?

"...Then anyone who leaves behind him a written manual, and likewise
anyone who receives it, in the belief that such writing will be clear
and certain, must be exceedingly simple-minded..." Plato, _Phaedrus_

From: Ali Eslami <indigo@primenet.com>
Message-ID: <4cruoh$kaf@nnrp1.news.primenet.com>
Source record: 39433

I want to build a walkie talkie type thing and am wondering what sort of equipment I should look into for the device..I wanted to check few things to get some input on the best way to do this..For one, would it be less expensive to simply have a high-range radio, or to have each walkie talkie serve as a repeater..So if I had some friends playing paintball out in a small field, would I be better off making each radio be able to transmit a decent distance, or to have each act as a repeater for transmissions it recieves thus extending possible range..And also, what if I wanted to just make it a shorter ranged device, but with obstructions and things, such as for a moderatly sized home..
What equipment would you recommend that wouldn't end up costing a whole lot, and what frequency ranges should I be aiming for for best preformance without interferring/interferance with other radio transmissions?

Thanks in advance,

-Indigo

Date: 7 Jan 96 13:54:31 CDT
From: moorepa@wkuvx1.wku.edu
Subject: HELP-Hamcomm recv interface problems

Last night I downloaded a copy of Hamcomm version 2.2 and tried it - the interface schematic is the same. RTTY copy was unintelligible until I hit the tab key to reverse - I was listening on 20 meters. Then, I was able to copy occasional words and callsigns, but nothing like a complete transmission. Copy improved when I cranked the audio gain on the TS-440 to near max, but still not the the point where I could call it usable. I'm beginning to suspect that the 741 op amp doesnt' have enough gain in this application.
We (now three of us - follow the thread backwards) need more information - has anyone else tried HamComm? Has anyone gotten it to work? Does anyone have any other non-TNC solutions to copying teletype that don't involve motors and oil-dripping machinery?

Subject: MFJ-1278B Kiss mode - HELP!!

Hello!
I'm using a MFJ-1278B in KISS-mode with BPQ 4.08.
I have problems with very long pauses before the TNC starts to send
packets - it is reluctant to send.
Further investigation indicates that the PERSIST-parameter must be set at
a low level.
The PERSIST parameter should be possible to set by means of command 2 in
kiss-mode. I have tried this by sending FEND 0x02 0xFF FEND to the TNC,
but it seems like it sends the data on the air instead of interpreting it
as a command. FEND 0x01 0xFF FEND works well (setting TXDELAY to 255).
Any ideas of what this could be ?
It drives me mad !

Subject: MFJ-8621 + KPC3

I purchased a mfj data radio yesterday and can't get it to operate
correctley. I made a cable to connect it to the kpc3 and it transmits,
but I can't get it to receive. I am unsure of some aspects of the set
up. What should the baud rate be set at for the tnc. the mfj comes set
at 1200 but the kpc3 won't sign on unless it is set to 9600. if any
one has experence with this combination could they please respond to
this message.

Point your browser at http://www.wa4dsy.radio.org:80

You'll be experiencing 56 kb full duplex links on 222 MHz
using the *new* WA4DSY modems. The web server is running under
OS/2 Warp and uses the full duplex 56 kb repeater located on
Sweat Mtn near Atlanta.

Subject: Packet Freqs in NE (2 Meters)

#This file contains the latest PBBS, tcpip switch, full time Nodes and YCCC
#packet user's frequencies on 2 meters in the New England area. Please let me
#know of any proposed changes or corrections so the list remains current.
#This file can also be used as a data file for the PLANnn.EXE and PLNGRFnn.EXE
#programs which are available for FTP in zipped form from the public directory
#on switch.bedford in Bedford, MA. PLNGRFnn.exe is now truely generic - it can
#be used for any location for which there is a APRS map available.
#The latest version is 37 and displays lighthouses too!
#I will also return copies of both programs upon receipt of a formatted disk
#and SASE. [Standard envelope is ok for 3.5 inch disk.]
D.G.Willard, W1EO
39 Long Ridge Road
Carlisle, MA 01741

Subject: Single-chip Radio

Just what freqs/modes are you after ? An A.M. chip (the ZN414) has
been available since the early 1970s covering up to 3 MHz. Many single
chip FM/VHF I.Cs are now in use ... Walkmans,car radios etc

Subject: Using the internet to link repeaters??

Interesting Idea - However given the snails pace of the net for the
last few days...and actual crashes..do you think its practical for all
but control?

From: djbeck@mmm.com (David J. Beck, P.E.)
Subject: Wanted: KPC-1 v2.70 EPROM image needed

Greetings,
I am asking for help. I have a Kantronics Packet Communicator model KPC-1 (ROM version 1.6). And I received information to update the hardware to version 2.70 from them.

They used to provide an update kit but had so few requests for the kit that they discontinued the kit. Their tech support was very helpful in locating and FAXing to me the instructions for the hardware update which I've completed.

The update kit used to contain:
1. New program EPROM (U4)
2. New EEPROM to replace the NOVRAM in versions 1.5 or 1.6
3. New RAM (U6)

What I need/request is for anyone who has an upgraded KPC-1 who would be willing/able to send me the EPROM image.

Thank you for your assistance.

David J. Beck, P.E. (612)736-1175

>

I have read of this mod but have never tried it on my FT-757GX.
Actually there are two mods. Both involve rewiring the MOX switch so
that one of the cw filters is in line irregardless of mode. The other
mode went a step further replacing a filter with one from the FT-101
series.

I'll check some ftp sites and let you know where to find the details
of the mods.

From: herksen@ibm.net
Message-ID: <4ctq9b$2iis@news-s01.ny.us.ibm.net>
Source record: 39343

Hi there,

One of my favorite dreams is, having a packet modem in a PCMCIA card,
so that I can be packet mobile, using my Hewlett Packard HP200LX Palmtop
computer.

Anyone knows a place or a person that has one??

Hi Laurence.

I have a Sangean ATS-803a. It is a digital unit with a BFO and covers
1 to 30 MHz plus commercial AM & FM bands. With the use of the external
antenna jack, and an outside wire, I can decode 300 baud packet via my
TNC. But other than that...thats all Ive done.

Take care, & 73.

Interesting, I've been working intermittently on a program like this for 2 meter packet. Can anyone tell me if I'm re-inventing the wheel?

I stopped at the point where I needed to build a op-amp circuit for squelch detect. I can't find a copy of the JVFAX71 program on the net but it sounds an awful lot like what I was planning to do.

Looks to me like you are not realizing yet that much of the machine-to machine data is now encrypted similar to or exactly like PKZIP and PKUNZIP do for compressing data to conserve space on floppy and hard drives, etc. Compression of the data stream allows less crowding of the packet frequencies. Much of what you see is compression, and of course much of the control codes blipped back and forth between nodes prints out gibberish characters on the screen of someone trying to monitor such traffic.

<snip>
> Since nobody's mentioned it yet... A MUCH better solution to this problem
> is the use of full duplex packet repeaters. We have one locally running
<snip>

Has anyone considered using two different frequencies for these two BBSs? Those 'people 20 miles away" would then be on a different frequency. Oh, horrors, those BBSs aren't passing traffic on the user frequency, are they? If so, you deserve all the problems you can get.
For the price of a repeater, you can set up user ports every 15 miles or so, and have them all link (on a different frequency and band) to the BBS with their own quiet little channel. EVERYONE will get seriously better performance.
The point is: either set up a proper network, or quit complaining when it doesn't work right.

By the way, the suggestion "use a tall omni, and lots of power" is essentially correct.

73,
Don N2IRZ

166. Help for FDK MULTI 700 packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-09 00:00:00 UTC
From: BOSIO@vm.uni-bocconi.it
Message-ID: <96009.093954BOSIO@vm.uni-bocconi.it>
Source record: 39352

Hi All,

We are experiencing a strange problem in operating a packet station using
an old PLL transceiver, the FDK MULTI 700. The RTX has two separate inputs
on the front mic jack for PTT and BF input and a rear jack for EXT speaker.
We've connected the radio to a KPC-3 in the usual way and all seems to be
ok. While in receiving the station does'nt miss a packet in transmitting
other stations can't decode packets. The AFSK audio output from the RTX
, monitored with a second receiver, seems to be ok and tones are like any
other packet tones. The only tnc parameter we've tried to change is the
TXDELAY but with no success ...
Any ideas of what it's happening ?

Thanks and 73

>an idea running thru my head!

You might want to listen to the audio samples on Phil Karn's web page. Speech coded as tightly as 2400 baud is intelligible, though at 11 kb using QCELP encoding it is much closer to what we'd accept as "repeater quality", and good enough for digital cellular phone. You can also listen to any of the Real Audio sites on the net. The base rate fits in a 14.4 kb modem stream, though the higher quality RA 2.0 requires a 28.8 kb connection for good quality stereo audio. I expect that "communications quality" mono speech could easily be fitted into an 8 kb data stream.

I believe Motorola offers such an encoder on a single chip, and Karn offers C source code that can implement it with just a sound card in a 486 class machine (Turbo C++ and GNU C++ versions for DOS and Unix respectively).

64 kb PCM coding isn't necessary, and is actually rather passe.

Need Pascal Source Code for PK-88/PK-232 (TNC)

I have an old HeathKit Z-100 computer which I would like to use for Packet/RTTY. I have seen several old MS-DOS programs that would work but, they dont run to well on the Zenith. PLEASE!! if you have PASCAL source code for a program that can provide decent communications with a PK-88, PK-232 etc. I would appreciate having a copy of the source code to convert for use on the Z-100 dinisour. I have Turbo-Pascal version 2.0 and 3.0 that run excently on the Z-100. One program that looked real good is the TNC.COM by WD0DUD/KA0DMJ, back in '86.

Thanks in advance Rich KE0ZX

Message-ID: <kwick-1001961003300001@wickwire1.mitre.org>
Source record: 39358

Am running some HF file transfer tests using NOS (actually NOS at the receiving station & NET/mac at the sender) and would like to get clear description of the ARQ protocol(s) that Karn's implementation uses. So far, our freqs/times show little contention.

In particular,

1. Is (are) the ARQ protocol(s) so-called stop-and-wait, go-back-N or selective repeat, or something else?

2. How do the parameters MSS (frame size) and WIN (frame-window size) affect the ARQ scheme? Is there a rule-of-thumb for selecting them for good throughput (especially for HF)?

3. How do the ARQ schemes differ when you use datagram vs virtual circuit mode?

Refs to Infobahn or other (understandable) sources ok. Reply direct if you want to kwick@mitre.org

In article <DKwJsG.1sv@freenet.carleton.ca>, cv282@FreeNet.Carleton.CA says...
> Hello, I am having problems trying to run the MMSCAN external mailer
>with JNOS. The program runs fine from DOS but won't run at all with the
>mail command from JNOS, or when shelling out to DOS from JNOS. The BM
>mailer works just fine. Does anyone use MMSCAN and know what the problem
>might be? Thanks.

The lack of memory is the most connon problem. Before you try to use the 'm'
command in JNOS, try doing a 'mem stat' command and look at the core left. If this is
fairly low, like below 100k, chances are that this is the problem. You might need to try
a mailer that uses a little less over head like Pcelm. This should be available vis FTP
from carleton.ca.

Hope that this helps out......

From: pst@cisco.com
Message-ID: <PST.96Jan10154159@puli.cisco.com>
Source record: 39362

I'm setting up a small NETROM network using NOS boxes.
We're using several different frequencies and several different
link formats from:
reliable high-speed local AX.25 over IP tunnels (non-radio)
256k radio links
mostly reliable 56k AX.25 over IP tunnels (non-radio)
56k radio links
9600 bps radio links & access points
1200 bps access points and grandfathered links

I understand how NET/ROM works and understand routing quite well,
what I don't have is the operational experience in running a NET/ROM
network that would help me come up with good rule-of-thumb numbers
to use for setting link quality parameters so we can make decisions
like:

Take the 56k path unless we have to hop through more than n'
switches if the 9600bps path is direct...

This just translates into LQM numbers like:

HS tunnel 250
256k link 200
LS tunnel 150
56k link 100
9600 link 40
1200 link 15

minimum 10

sorts of things... (I may have this backwards, I'm really new at
NET/ROM).

Paul,
Contact the North East Digital Association (NEDA) at PO Box 563, Manchester NH 03105, and ask them for a copy of their parms list. They also have an book about 200 pages thick with exactly what you need in it, along with very detailed explanations of why each parm is chosen just so, and the effects of changes. Membership is $15/year, well worth it.

They also have a WWW page, but they don't take E-Mail through it.

73,
Don N2IRZ

184. KAgold question

Just tried the test version of KAGOLD. When I exited and tried using
my packterm again it does not accept commands!!! I had this problem with
another program and had to HARD reset the tnc. Packterm may be a very
basic program but it doesn't give me fits like the other ones I try. I
actually like it. I fear I now have to hard reset the tnc (Again) and it's
a pain to have to reset all my settings. Is there away around this? Why
does these other program screw around with the tnc settings to begin with?

Help via e-mail appreciated!!

Could someone tell me how I can use the ax25-utils to set up a default
route for ax25 as follows :
==> all packet have to go by default to ON1KUL-10 VIA ON4CP-6
I tried to do this with axparms -add 1 ON1KUL-10 ON4CP, but all the
packets for ON1KUL-10 go directly to it instead of VIA ON4CP-6...
We have been searching on this for several hours now, but we can't work
it out... Who can help us with this please ??
Thanks for the reply.

>73 de AL7L

You can improve the performance of the interface circuit in a simple
manner. I'm refering to the circuit as you can find the schematics
in the doc file.

Remove the resistor R2 of 100 kohms which is located between the
pin 2 of the op-amp and the ground. Replace it by 3 components in
parallel, a diode with the cathode at ground, another with the cathode
at the pin 2 of the op-amp and a capacitor of 1 uF. Insert a resistor
of 150 kohms between the output of the op-amp (pin 6) and the inverting
input (pin 2). Use common low-signal Si diodes, e.g. 1N4148 and use
a low loss capacitor.

Try it and have fun.

73,
Claude

192. Arcnet cards with Wnos or any Nos

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-10 00:00:00 UTC
From: jpheulin@ix.netcom.com
Message-ID: <4d0jlu$ml0@ixnews3.ix.netcom.com>
Source record: 39372

Hi Group

A few months ago I got a pair of AL-3351 Arcnet cards for $5 each. I would like to use them between my 486 running Windows (trumpet winsock, Eudora, Ws_ftp, Ewan telnet) and an old 286 running Wnos. It's working at the moment with winsock configured for a slip link thru the com port, but I want to put the 286 at the top of the hill back of my place (to improve the 70cm 9600 bds side).
That's about 150 feet away (~ 50 meters) and 100 feet higher than the house.

Has anyone ever used these cards with Wnos ?. (Any Nos!)

I got the Arcnet driver and also a Arcether driver from Crynwr software and tried them both.
I recompiled Wnos with Arcnet support but am confused about a few things.

The ATTACH PACKET command's last parameter [ip_addr]. What ip address are we talking about here ?.

When I do 'ARP ADD callsign ETHER address'. What address is this, Is it

the ip address of my other PC or the address of the arcnet card ?.

I have tried just about every combination without success. At the moment I am trying to make it work with WNOS at both end. When I get it working I will mess with Windows 95...

Do I need to dump these cards and buy new ones, if so which ones ?

Hope somebody can help.

By the way I am using wnos4b0 to which I added the QRZ callbook server and pop3. It runs on a 640k 286 with just 1 floppy drive and has never crashed... Off course the callbook is on the 486's cdrom drive.

Hi Tom... Sorry to say; a lot of the Test Drive programs, do a auto baud
routine an will change, the TNC to computer baud rate.... Then when your
done, it won't work with the settings of your original program. The simple
thing to do is to check the baud rate in the program you always use, write
it down. Then when you try another program, check the baud rate its running
at <Abaud>. Then change the Abaud before you jump out of the test drive
back to your normal setting... A "LOT" of these programs use different
parms, so if you have favorite settings in your tnc, you'd better do your-
self a favor... Do a listing of your tnc settings an do a screen print out.
This way you can see the differences in the different programs an tailor
the parms to your liking...
Hope this helps...

I was wondering what the maximum legal baud rates for the 160, 80, and 10 meter bands are. If there is no "maximum legal," what are the maximum reasonable rates for these bands (without causing interference to adjacent frequencies)? I thought I saw it in the ARRL Handbook, but if I did, I can't seem to find it anymore.

From: tvr@skywebs.com
Message-ID: <TVR.96Jan11121142@skywebs.com>
Source record: 39383

: | I use it without exception. We had a WHOLE spate of people pirating
: | callsigns, sending some rather nasty messages. I started the ball
: | rolling by installing PGP and preaching to the masses, how wonderful
: | PGP is. [...]

: Actually, I believe I was first...

I would think that the FCC would construe this as illegal behavior,
tho, because you are using a scheme of "encryption" that is not widely
accepted... Maybe in your area, yes, but not world-wide, *yet*.

In general, you cannot use PGP under Part 97, except possibly for satellite
control under 97.211(b), as Part 97.113(b)(4) prohibits tranmission of:

... messages in codes or ciphers intended to obscure the meaning thereof;

However, you *might* be able to use PGP for *authentication* purposes, as
if anyone can decode the message, then (as i read it) this is not intended
to obscure but rather to facilitate communication, as it could be used to
provide additional identification, for control purposes, and to allow for
automatic retransmission of bona fide amatuer communications that would
otherwise require manual intervention. Such use may well be acceptable.

Be aware though that other branches of government are seriously in opposition
to PGP, as it is a powerful tool that has many other uses which they would
not be happy with. So, some degree of caution might be appropriate here, so
said branches don't put pressure on the FCC to prohibit things we'd like to
do. Let me remind folks the author of PGP is currently involved in a legal
battle over PGP.

On the other hand, PGP may still be a very valuable tool if not over the air,
for example, for making sure that messages sent over the Internet intended
for retransmission indeed originate from another station in the Amateur
Service (this assumes, of course, that the PGP encoded part of the message is
not sent over the air).

If you go to ftp.ucsd.edu, you'll be able to download the source code for Jnos. It's up to version 1.10M which has just been released. I would recommend using Borlands C+ version 3.1 or higher to compile it with though. Be careful on which version of Tasm you use. It will make a difference on your source setup.

It has probably placed your TNC in "Host" mode; you probably like to
have it in Converse mode.

If you recall what speed you were using for the Gold demo, match
that speed with your terminal program (if it differs) and attempt to
send three plus signs. Some TNC return to converse mode with that
sequence.

Alternatively, set your Other tnc program to Host mode and off you
go!

There is a great deal of activity on this subject. The ARRL has just filed its spread spectrum deregulatory petition with the FCC, and more may yet be to come. TAPR has started a spread spectrum mailing list (check the TAPR WWW site).

So would a lot of us! I'm a little disappointed that the PANSAT radio designs are not yet in the field.

I'm also looking for a UNIX program to talk to my TNC. I'm running SunOS 4.1.4, however. Yes, I know I can tip to the TNC and run AX.25, but I'm interested in running TCP/IP.

Before I reinvent the wheel, does anyone know if ka9q has been successfully ported to non-Linux UNICES? Should I just grab the Linux source code and use that as a starting point?

Or should I just uncrate the old MS-DOS box that already has ka9q on it?

The FCC disagrees. In their reply to Phil Karn's petition on forwarding systems, the FCC specifically *encouraged* amateurs to use verification procedures such as the PGP digital signature to validate their identity and to reduce forgery of message traffic in the system. If such steps are used, the first forwarder is considered relieved, to a major extent, of his responsibility for the content of the message since there would be a verifiable point of origin for the message.

In article <Pine.SUN.3.91.960111232807.10212A-100000@Isis.MsState.Edu> Will Parker <whp1@Ra.MsState.Edu> writes:
>I was wondering what the maximum legal baud rates for the 160, 80, and 10 >meter bands are. If there is no "maximum legal," what are the maximum >reasonable rates for these bands (without causing interference to adjacent >frequencies)? I thought I saw it in the ARRL Handbook, but if I did, I >can't seem to find it anymore.

As listed in Part 97.307(f)(3) and 97.307(f)(4), data transmissions may not exceed 300 baud on HF bands other than 10 meters. On 10 meters a maximum baud of 1200 is permitted. Note: baud != bps for some modulations. Baud is symbols per second, but symbol overloading may allow more than one bit to be transmitted per symbol. So data rates considerably higher than 300 bps are possible on HF.

Total frequency shift (if used) must not exceed 1 kHz, and total occupied bandwidth must not exceed that of an A3E phone emission per 97.307(f)(2).

Now that's legal, but what's practical? On fading HF circuits, baud in excess of 50 will suffer severely from intersymbol distortion. That's one of the myriad reasons 300 baud HF packet sucks so badly. Nor will more power generally help, since the interference comes from your own transmission delayed by the ionosphere. If you increase power, you increase the delayed signal's strength too.

The answer is to use a low basic baud while utilizing symbol overloading. Clover II uses 31.5 baud as the basic symbol rate. By overloading, bps up to 750 can be achieved with 16FSM if SNR is adequate. Other overloadings are possible, of course, notably QPSK and QAM. For ARQ protocol modes, use of FEC is highly recomended. HF channel errors are typically burst errors, so a FEC method strongly resistant to burst errors should be used. A technique called "interleaving" is highly recomended. That has the effect of "smearing" burst errors throughout the frame, allowing simple error recovery methods. (Convolutional coding has the same effect for non-block oriented transmissions, but if you use the more powerful Reed-Solomon block codes, interleaving is a must.)

Typical HF practice is to use the minimum possible occupied bandwidth as an interference control measure, but for best weak signal performance, use of the widest permissible bandwidth in conjunction with proper signal correlation in the receiver will yield the best results. That's a non-obvious corollary of the Shannon theorem.

The disadvantage is that it ties up your $3000 computer doing bit banging better handled by a $5 Z80. If you've got nothing else for your computer to do, it works adequately for 1200 baud AFSK.

>TNX Glenn =

Hello, Glenn -

There was a similar thread on here a couple of months ago, but I don't recall that the 'solution' was ever written up so I'll do it now.

Some 486+ computers with some BIOS set a system timer (Timer0) to the 'wrong' mode (Mode 2) for some BayCom-type programs. You didn't say anything about your computer or the actual software you are using so this may not be your problem, but it sounds familiar.

One solution is to run a program called PMPFIX10 by KM6PI before you start the BayCom-type program (there are too many to try to name them all, so I'll use BayCom-type to mean a program that acts like a TNC in software and uses a simple modem for the computer/radio interface). If you can't find this program on the net, send me a note and I'll send it to you uuencoded. It's freeware and includes the C source code and a small ,DOC file. Uuencoded size is about 10k.

If you are using AX25.COM by Pawel Jalocha, I can send you a couple of replacement procedures which will make the Timer0 mode change. You'll have to recompile it. If you are using BPQAX25.EXE by G7JJF, I can send you BPQBAX25.COM by myself which is a plug-in replacement, and has the Timer0 mode fix incorporated into the AX25 'kernel'. Incidentally, it was G7JJF who rooted out the PMPFIX program for me when he was testing my variation of the original AX25 code for BPQ and found that neither program would work on his new Pentium, although BayCom did work.

If you are using something else, you could either run PMPFIX or, if you have the source code for it just modify it to set Timer0 to mode 3 before starting the rest of the code.

Hope this helps. Send me a message if you need 'one of the above' via email. 73

SPARTAN PACKET RADIO EXPERIMENT (SPRE)

Setup Information for Participating Amateur Radio (HAM) Ground Stations

By: Ken McCaughey (N3FZX)
File: ham01.txt
Date: 20-DEC-95

1.0 INTRODUCTION

The Spartan Packet Radio Experiment (SPRE) is open to amateur radio operators and schools who want to participate. This document will guide you in your preparations for the SPRE mission. Included are some guidelines that will help you to determine if you can hear SPRE and what level of equipment you will need. Please read this document thoroughly. If you have any additional questions please contact the SPRE Project (see Section 10.0).

2.0 MISSION PROFILE

SPRE is one of four experiments on-board NASA Goddard's Spartan OAST-Flyer spacecraft, also known as SP-206. The Spartan spacecraft is one of the primary payloads on the STS-72 shuttle mission slated to launch January 11, 1996.

SPRE is designed to relay ground station positions and transmit telemetry containing the GPS location of the spacecraft and housekeeping data. The GPS data is generated by another Spartan experiment and sent to SPRE via a serial connection. Special software called APRtrak (tm) will be used at SPRE ground stations to provide a mechanism to plot the positions of stations and objects world-wide using SPRE transmissions. Ground stations can transmit their locations to SPRE, and if heard, SPRE will relay GPS information back to Earth. All ground stations within range of SPRE will see the relayed station locations plotted on a map. APRtrak system can plot and track both fixed and mobile ground stations. The APRtrak software will decode and display SPRE housekeeping telemetry including temperatures, voltages, and system status, along with the geographical positions.

SPRE can be used as an educational tool in many classes including math, science, and geography. The APRtrak software with its colorful graphics

and maps is available on Internet for installation on IBM compatible computers. Even if a school is not in session during a fly-over, a simple packet radio station can be set up to listen to the SPRE telemetry and record the data for later use.

The spacecraft will be deployed by the robot arm 3 days and 2 hours (3/02:00:00) Mission Elapsed Time (MET). After deployment the shuttle will distance itself away from Spartan (up to 100 miles). The battery powered spacecraft will perform its mission following a preprogrammed routine.

SPRE operations will start 2 hours and 41 minutes after the deployment and continue for approximately 46 hours. During the mission the attitude of the spacecraft will be changing. The spacecraft will make about 33 orbits before retrieval.

Near the End-of-Mission (EOM) the shuttle will approach the spacecraft for pickup. At approximately 5/00:30:00 MET the spacecraft will be grappled by the robot arm and returned to its berth in the cargo bay, thus ending the Spartan 206 mission.

Mission Summary

Mission: STS-72, Space Shuttle Endeavour (OV-105)
Launch: January 11, 1996 at 09:18 UTC (60 minute launch window)
Orbit: 28.45 Degrees Inclination
Landing: January 20, 1996 at 04:54 UTC at KSC

Spartan Deploy: ~3/02:23:00 MET
SPRE mission: Starting 2 hours 40 minutes after Spartan deployment operational for approximately 46 hours
Operating Mode: FM, AFSK 1200 baud packet radio
Frequencies: 145.550 MHz Simplex
Callsign: W3EAX, unproto mode only, do not connect!
Retrieval: ~5/00:30:00 MET

3.0 BASIC SATELLITE COMMUNICATIONS TUTORIAL

This short tutorial is written with SPRE communications in mind. It does include some specific information regarding the Spartan orbit.

In order to communicate with a satellite, its antennas need to be within line of sight of the ground station antennas. When a satellite is in "line-of-sight", you can not necessarily see it. It only means there is an unobstructed path between the two points. Satellites can only be seen visually if they are passing over your location around dusk or dawn.

At an altitude of 165 miles, the Spartan spacecraft has a circular "foot print" that is approximately 1000 miles in radius with the spacecraft at the center. The foot print is the area of the Earth that is in line-of-sight of the spacecraft. This circular foot print moves with the

spacecraft. A ground station that is within the foot print is within line-of-sight of the spacecraft. Where you are within the foot print will determine the angle, or elevation, of the spacecraft above the horizon. During a pass, the spacecraft will rise and set like the Sun and Moon, only much faster.

The quality of a pass is determined by the maximum elevation during a pass. The higher the elevation, the better and longer the pass. The general rule of thumb is that a satellite needs to be at least 5 degrees above the horizon to be heard. However, this will vary depending on the station setup and local topography. A good pass will have an elevation greater than 20 degrees. Passes can last from as little as 10 seconds to as long as 10 minutes. Most satellite tracking software packages can predict passes accurately to within seconds if the orbital elements are up-to-date.

The Spartan spacecraft will be in a 28 degree inclination orbit. This means the orbit is tilted by 28 degrees with respect to the Earth's equator. Therefore the spacecraft will only be directly over head as far North or South as 28 degrees. However, since the spacecraft is 165 miles high and because of the size of the foot print, it is within radio range of stations much farther North or South .

As mentioned in the beginning of this section, the antennas of both the spacecraft and the ground station need to be in line-of-sight. This is not always the case during a satellite pass. This is because the antennas on most satellites have a degree of directionality to them. During a pass the antennas might not be pointing at the ground station antennas, or even the Earth. The orientation of a spacecraft is referred to as the attitude. In the case of SPRE, the antenna system was designed to be as independent of the spacecraft attitude as possible. However, there are some spacecraft attitudes that will result in a degraded signal. During the Spartan mission the attitude will be changing due to the other experiments.

4.0 CAN I DO THIS AT MY LOCATION???

The following are some things to consider if you want to participate with SPRE. There are different levels of participation to be considered as well.

4.1 SPRE Passes

Before setting up any equipment it is important to determine if SPRE will fly within range of your location. If it does, the quality of the passes needs to be considered. To make this assessment, first look at a map and determine the latitude (degrees North or South of the equator) in which your station is located.

If your latitude is greater than 43 degrees, your chances are hearing or relaying through SPRE are zero.

If your latitude is between 40 and 43 40 degrees, your chances are hearing SPRE are very poor. Your chances of relaying a signal through SPRE are about zero.

If your latitude is between 35 and 40 degrees, your chances are hearing SPRE are very good. Your chances of relaying a signal through SPRE are poor without a well equipped HAM radio satellite station.

If your latitude is less than 35 degrees your chances of hearing SPRE are excellent. Your chances of relaying a signal through SPRE are good with modest equipment if there is not much competition on the uplink.

Latitude	Hearing SPRE	Relaying Through SPRE
> 43	No Chance!	No Chance!
40 - 43	Poor	Very Poor
35 - 40	Very Good	Poor
< 35	Excellent	Good

4.2 Levels of Participation

There are two levels of SPRE participation. These levels have varying complexity, interaction, and equipment requirements.

Full participation would include a setup with APRtrak and an amateur radio station capable of transmitting through SPRE. This implies that the station is at a favorable Latitude (see above). A sophisticated station with big antennas and a high powered amplifier are not necessarily required for full participation.

The next level of participation centers around receiving data instead of the ability to transmit to SPRE. This mode of operation requires the least complex equipment and less effort. This may be the mode of choice for stations located in unfavorable latitudes. APRtrak along with a TNC and almost any VHF (2 meter band) radio will work, even a hand-held radio. The antenna can be as simple quarter wave vertical. The more favorable the Latitude the simpler the equipment to receive data. The station can be operated during a pass or APRtrak can be setup to just listen and collect data. All data can be saved to the computer hard disk. All data saved to disk can be replayed on the screen!

5.0 GROUND STATION SETUP

This section covers the equipment needed to participate with SPRE. It has been the goal of the SPRE Project to make it as accessible as possible to the amateur radio and educational community. We have tried to make the ground station requirements as simple as possible. In general it does not take much power to communicate with SPRE. Since the SPRE foot print is so large, it is potentially within range of dozens or even hundreds of ground stations. All these signals will be competing with each other at the SPRE receiver. If there are a lot of stations transmitting at the same time, then usually the biggest signal wins. However, if a low power transmitter

is sending at the right time it can get through just as easily. Always used the least amount of power needed to communicate with SPRE.

5.1 Hardware

IBM compatible PC:

Recommended configuration	Minimum Configuration
386, 486, or Pentium processor	XT
VGA color monitor	CGA monochrome monitor
640KB RAM	640KB RAM
4MB free hard disk space	3MB free hard disk space
3.5" floppy disk drive	3.5" floppy disk drive
RS-232 Serial Port	RS-232 Serial Port

Simple packet radio station setup:

- Licensed Amateur Radio Operator
- Terminal Node Controller (TNC)
~ TAPR-2 compatible
~ 1200 BAUD AFSK
- VHF Radio (amplifier recommended if transmitting to SPRE)
- VHF Antenna (beam recommended if transmitting to SPRE)

Note: If you have an amplifier and a beam antenna, it is more likely that you will be successful in communicating with SPRE. It is NOT, however, recommended that you purchase this equipment to attempt communications. The length and scope of the SPRE experiment is too narrow to justify a major expenditure.

5.2 Software

APRtrak:

APRtrak Version 0.5 is the program that is required to work with SPRE. APRtrak is similar to another program called APRS. However, APRtrak contains SPRE specific implementations for decoding the spacecraft position and telemetry. It is important to get familiar with APRtrak before the SPRE mission starts. This will increase for success rate. APRtrak includes documentation on how to make local maps, how to run simulations, and general information on GPS tracking.

APRtrak is available on the Internet. Below are just two of the many places on the net where APRtrak can be found:

W3EAX, University of Maryland Amateur Radio Association:
URL ftp://w3eax.umd.edu/pub/spre/aprtrak/aprtrak.zip

AMSAT:
URL ftp://ftp.amsat.org/amsat/software/PC/tracking/aprtrak.zip

Unfortunately, APRtrak for Apple and Macintosh computers are NOT supported.

Satellite Tracking:

APRtrak has the ability to track up to ten satellites. The orbital elements for SPRE and the shuttle may be loaded into the system. There are many satellite tracking programs available on the Internet. The AMSAT FTP sight has several program available. In addition, orbital elements for satellites are available on the AMSAT site.

AMSAT:
URL ftp://ftp.amsat.org/amsat/software/PC/tracking/

6.0 PRE-FLIGHT ACTIVITIES

The following are some suggested activities to work on before the launch.

- Play around with APRtrak and replay the simulations. It is important to get familiar with APRtrak before the launch.

- Identify the latitude and longitude location of your station on the APRtrak maps.

- Simulate the SPRE mission using satellite tracking software and the pre-launch orbital elements.

6.1 PRE-LAUNCH ORBITAL ELEMENTS

The preliminary orbital elements below may be used to simulate or predict when SPRE will pass over your location. It can be loaded into most any satellite tracking program. For best results, be sure your simulations use the dates and time listed in the Mission Summary above.

Note: These preliminary elements are for Spartan Spacecraft only, not the shuttle. They are subject to change.

Satellite Name: SPRE-00
Satellite NORAD Number: #40000 <--(DUMMY VALUE)
Element Set Number: 1
Elements Epoch: 96014.48984950
14 JAN 1996 @ 11:45:22.997 UTC
Orbit # at Epoch: 1
Inclination: 28.4779
RA of Ascend Node: 71.7928
Eccentricity: .001131
Arg of Perigee: 189.8166
Mean Anomaly: 358.1771
Mean Motion: 15.85695266
Acceleration/Drag: .0000177
BSTAR Drag: 0

Two Line Element (TLE) Format:

SPRE-00
1 40000U SPRE-00 96014.48984950 .00001770 00000-0 00000-0 0 11
2 40000 28.4779 71.7928 0011310 189.8166 358.1771 15.85695266 18

7.0 SPRE FLIGHT OPERATIONS

During the SPRE mission ground stations will need to have APRtrak up and running and setup for SPRE at least 15 minutes before a predicted pass. When the spacecraft initially rises above the horizon the signal will sound rather scratchy. The higher above the horizon it gets the more clear the signal will become.

Only attempt to transmit after successfully receiving some SPRE packets. Received packets are displayed at the bottom of the screen on APRtrak. If you can't hear SPRE, SPRE will most likely not hear you.

Watch the map to see other stations and the spacecraft. Do not zoom in to close or you may not see other stations. Set the zoom so that you are centered on your state and can also see at least one whole state on all sides.

7.1 OPERATING INSTRUCTIONS

DO's:

- Use APRtrak Version 0.5 to listen and/or communicate with SPRE.

- Use satellite tracking software to predict when SPRE will pass over.

- Set the comment field in APRtrak to the name of your school.

- Make sure your are recording all received data to the hard disk.

- Wait until you receive SPRE transmissions before attempting to transmit.

- Watch for other schools.

DON'Ts:

- Don't zoom in too close on the map.

- Don't attempt to connect using a conventional packet terminal program. It will not allow connects and you will be clogging the frequency with wasted transmissions.

- Don't transmit until you receive SPRE transmissions.

- If your locations has been successfully relayed by SPRE, please do not continue to transmit. Give other stations a chance to get through.

8.0 POST SPRE MISSION ACTIVITIES

The following are someone suggested activities to do shortly after the SPRE mission.

- Replay collected SPRE data using APRtrak.

- Send copies of your *.HST and *.LOG data files to the SPRE Project. We will take all the data files we receive and generate a composite file. This overview of the mission will then be made available to all schools and amateur radio operators.

9.0 QUESTIONS AND ANSWERS

Hopefully this will answer the most common questions. If not, send electronic mail to the SPRE Project (see Section 11.0 below).

Q: Do I need a GPS receiver.
A: No, APRtrack is used to setup your location parameters which are transmitted to SPRE.

Q: What is the difference between SPRE and SAREX?
A: SPRE will use packet radio in the un-connected or unproto mode. This means that stations can not connect to SPRE. This should ultimately provide more throughput. This experiment involves identifying the location of the spacecraft as well as ground stations. SPRE utilizes APRtrak with a graphical interface making it more interactive and interesting. Also SPRE is an automated system and not controlled by the astronauts.

Q: How can I find out when SPRE is passing over my location?
A: By using satellite tracking software and up-to-date orbital elements. Tracking software and is available in the Internet. Orbital elements are also available on the Internet including the SPRE WWW home page.

Q: Can the SPRE Project tell me when the spacecraft will be passing over my location?
A: No.

Q: Where can I get updated orbital elements?
A: They are available at the AMSAT FTP site and home page. During the mission they will be available on the SPRE home page (URL http://w3eax.umd.edu).

Q: Can the SPRE Project tell me what kind of antenna or radio to use?
A: No.

10.0 SPRE PROJECT

Participating stations should contact the SPRE Project so that we can try to keep you updated on any changes. Send electronic mail (e-mail) to Ken McCaughey at kenneth@w3eax.umd.edu.

SPRE Home Page: URL http://w3eax.umd.edu
Anon. FTP site: URL ftp://w3eax.umd.edu/pub/spre

The End...

Hello.

I have a KamPlus, vhf and hf radios, a 486DX2 computer with 16MB of RAM, and

a ULTIMITER II - Wheather Station with the PC Data Logger (softwere & cable).

The Ultimiter is working properly with the Pc Data Logger and it's cable

connected to the RS232 COM2.

My question is, how does the Ultimiter II makes the "Automatic Packet

Reporting System"? Where is connected the cable from the Ultimiter II, and

what commands must I give to the Kam?

Please,if you can help me, send a packet msg to the adress:

CU1BI@CU1ARM.CUAZ.PRT.EU

THANKS IN ADVANCE!!

> What's the disadvantage over a regular TNC. Thanks.

I haven't had any problems with it. Proper TNCs have the following
advantages:

different modems (like 9600 baud) can be attached
multi-tasking works
work with any computer
work with computer switched off

There are only 2 authorized vendors of Baycom 1.6 software here
in the US. PacComm is one; I forget the other. It is very forbidden
to put 1.6 on any BBS or FTP site. But, it is quite permissable
for one ham to make a copy for another Ham, this is stated on the
Baycom docs. So, if you wanted a copy of 1.6, I can discuss giving
you an individual copy. We can talk further over email, if you like.

Yep, it also works on a FBB-type bbs, but ONLY if the local sysop has
set up his listings compatible with GP. It has something to do with
the number of spaces between the From:, To:, etc... fields.

243. 10 Ghz full duplex?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-13 00:00:00 UTC
From: lazeraud@sentex.net
Message-ID: <4d8ar5$ft7@granite.sentex.net>
Source record: 39323

Greetings. I was wondering if anyone has implemented an "X" or "K" band packet link. Our main node stack is about 8 miles away from the LAN's node. This seems to be a great candidate for a high speed, full duplex link.

If you have experimented with this, I would like to hear from you.

p.s....The two sites are line-of-sight to each other.

Thanks and Best 73,

Tedd

Try Qualcomm, GEC-Plessey and Phillips. I would need more details before
I could provide more detailed info.

Larry

Don't forget National Semiconductors new PLL chips, I understand
they are some of the lowest phase noise PLL chips available.

There is a streams driver for SunOS that claims to support AX.25 to a KISS TNC.
So you could do TCP/IP with all the native SunOS utilities. I haven't tried it
personally.

At one time it was at ftp.ucsd.edu in /hamradio/packet/tcpip/sun.

Source record: 39330

In article <4da01v$b9g@newsbf02.news.aol.com> drathar333@aol.com (Drathar333) writes:
>Can anyone tell me what the minimum and ideal hardware someone would use
>for a digital station would be? Also where can I find out about digital
>networks around the world and in the U.S like a listinng of where they are
>and what they do?

There are many ways to do digital. On VHF, a minimum station might
be a Commodore C64+Digicom+HT, or a clapped out PCXT with a Baycom
and a HT, or a dumb terminal, a TNC2, and a surplus Motorola Micor.
Many ways, only the latter being vaguely satisfactory. Better starts
getting into PC plugin cards, such as the Ottawa PI2, attached to
a 56 kb RF modem, such as the WA4DSY (aka GRAPES or PacComm) unit,
feeding a transverter and running the TCP/IP protocol stack.

On HF there are many options as well, ranging from an old Viking
Ranger and a Hoff design TU used with a Model 15 Teletype up to
a HAL P-38 card in a modern PC used with a top line SSB transceiver.

The first thing a digital station needs is obviously a radio. Too
little attention is often paid to this aspect. What sets digital
amateur radio apart from the wireline services is *the radio*. So
we need to think about that part a bit more.

For any path, we need enough power to obtain a good SNR at the
receiver. And for CSMA simplex LANs, we need enough power to
be heard well by *everyone* in the LAN. That's necessary to
avoid hidden terminal problems and excess collisions which
harm the *entire LAN*. So HTs are usually a horrible choice
for the radio part of amateur digital operation. For VHF
packet, a radio of 15-45 watts output feeding a good outdoor
omni-directional antenna is about ideal. For duplex LANS,
IE those using a true digital repeater, the HT may serve
if it can reliably be heard by the repeater. (Cellular
technique is another option where a low power radio and
poor antenna can be tolerated, but that requires a degree
of cooperation among amateurs that is difficult to achieve.)

Now the above holds for 1200 baud AFSK. When we go to higher
speeds, other constraints pop up. Most modern synthesized
VHF/UHF voice grade radios are *unsuitable* for faster speeds.
That's because the synthesizer loop time constant *cancels*
part of the modulation, and because the receiver typically
has far from a flat phase response. Given that, we are limited
to crystal controlled radios, or radios which do modulation
outside the synthesizer loop, IE do modulation at an IF
frequency (typical of *multimode* radios). The TR turnaround

time of the radio also starts to become critical, and we need a radio that can switch in something on the order of 5 mS.

At higher speeds still, we must *abandon* the voice radio paradigm entirely and use a *RF modem* instead. This is both modem *and* radio, and is optimized for the digital modulation chosen. One example is the WA4DSY (aka GRAPES) 56kb RF modem, another would be Glen Elmore's 2 Mb system, or the ethernet over gunnplexer methods. Use of SS techniques can deal with multipath problems.

On HF our problems are magnified by the RF characteristics of the channel. The transmission problem is eased by the low bandwidth and low baud of the modulation. We can usually use the simplest CW transmitter with slight modification for FSK, or nearly any SSB transmitter for the more complex modulations. The receiver and demodulators, however, need to be something special for good performance. Because the channel is typically fading, and because noise bursts are common, we need a receiver with good dynamics, and we need a modem, and a coding, that are resistant to momentary interruptions and multipath induced phase distortion. DSP can be a great help here since it allows the modem to adapt dynamically to the channel conditions, but improved coding is where the real benefits lie. Clover II is an example of improved coding (and improved protocol, but that's a separate topic).

It seems the *minimum* requirement is fairly easy to define, but the *ideal* station is still a work in progress.

258. PPP with JNOS or other KA9Q?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-15 00:00:00 UTC
From: aswNS@hamp.hampshire.edu
Message-ID: <1e7cc$1671c.52@news.hampshire.edu>
Source record: 39243

I would like to use JNOS to do a PPP connect with my internet server, mostly in order to understand the PPP protocol a little better. But I am not quite sure how to do it -- the documentation I have is pretty sketchy, and the model I have in my Winsock setup hides most of the details from me. Any help or pointers to help would be appreciated.

This was discussed at some length on some of the other usenet groups.

Obviously, the '345' is incorrect, since it is >255. The conclusion from
the other group discussions was that the '345' was put in there on purpose, just
like all the phone numbers in movies start with 555-XXXX.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

268. List Opened for Those Interested in High Speed Spread Spectrum Digital Communications

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-15 00:00:00 UTC
From: "John A. Hansen" <hansen@ait.fredonia.edu>
Message-ID: <30F9CE23.7F0A@ait.fredonia.edu>
Source record: 39338

Hi,
A week or so ago I posted some preliminary results of experimental part 15 3 mbit/sec digital
links that we have been playing with at SUNY-Fredonia. Since then I've received quite a number
of inquiries about the equipment and its performance. Interestingly enough, most of the replies
came from folks who were not necessarily hams, but were interested in specific commercial
applications of this technology. In order to facilitate communication between those who are
interested in this stuff, I've initiated a list on my own listserver. I will post the results of
our experiments there and I hope that others will do the same. We are expecting this week to
receive some higher gain antennas which should let us stretch the range a bit. If you are
interested in participating (or eavesdropping) you may join this list by sending a message to:

listserv@ait.fredonia.edu

with a text (not subject, but text) of

join wireless

Thanks for the bandwidth.

Don't know of one. I was on the HP-95LX development team and I used the 95
with the Paccom handipacket (still sell it and I still use it). It has
internal batteries and size of 1.5 cigarette packs. I used that, the 95LX,
Kenwood 215 and could put all that in a 10 cassette audio nylon case -- nice.

As for the PCMCIA device. I heard a few years back that a company in
japan was working on one, but it was not clear it could fit in PCMCIA.
It was the same company apparently that did the Heakit TNC (small portable one).

As for the 200LX, keep in mind you are limited to 100ma at the port and at
that, it means very short battery life for the 200LX. I recommend the other
route above. It is not all that bad.

With the Paccom, you will be best off if you can get away from the rubber duck
antenna on the radio. I found the full size 5/8 or 1/2 whip works fine.
Just place things away from the TNC and 200LX. (The TNC is generating lots of
noise.) I hear you can cut one of the clock lines in the TNC going to the port
(the clock is not used), and that helps a lot. I am not sure I saw much of
a difference. I also added a ferrite bead to the TNC cable to the radio.

(I suspect that is why Paccom only ships cables that are 6" long -- they
would radiate like crazy.)

I suspect the ones they ship today are better, but I do not know. Mine was
5 years old and just upgraded the ROM.

Good Luck.

The show airs LIVE at 6:00pm ET, 2300utc, Sundays on the Talk America Radio Network in over 62 cities. Check WWW page for list.

The show also airs on WWCR shortwave. Check 5.065mhz for our live show or taped delay on Saturdays at noon ET (1700utc) on 12.160, and Mondays at 1000utc on 7.435.

Also, LIVE on C-band satellite....Spacenet 3, Transponder 9, 6.8 audio.
Support "WOG". Written only General!!!

271. Interesting Internet Stuff

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-15 00:00:00 UTC
From: mack@mails.imed.COM
Message-ID: <9600158217.AA821738142@mails.imed.com>
Source record: 39341

I just saw "the Net" last night. A good movie! Did y'all notice the interesting choice for the villain's IP address? 128.25.345.200. Most of it was pretty accurate technically. The hit man obviously new his technology (albeit not quite correctly) when he asked for the cell sites that a phone could hit so he could triangulate the location of the hero (I never liked heroine for a woman. sounds too much like a bad substance!).

Hello to all:

Come a take a look at my new web page. I have been working on it for
the last 4 weeks. I have lots of thing that you will like. Some of the
things that I have are: MODs, Swap Shop, Dfw repeter list, comment page,
links to other good ham pages, call looks ups (updated by the sec), radio
pricing, Links to QRZ,FCC,HRO, and many more. If you are a ham and would
like you web page added to my list just send me e-mail. Please tell me
what you like and dislike about the page. I want all types of comments.
Hope you like what I have.

274. L2PCX 9k6 emulator

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-16 00:00:00 UTC
From: l.pickering@psyc.canterbury.ac.nz
Message-ID: <4desq8$bej@cantua.canterbury.ac.nz>
Source record: 39254

Hi all, I note some recent activity on this newsgroup regarding the L2PCX 9k6 software TNC emulator.

I tried out a test version of this earlier last year and had a great deal of trouble trying to get it to interface to anything. My understanding was that it looked like a WA8DED interface to anything that was to be attached to it.....

I have tried FBB, TSTHOST, T4, and TPK, (all of which work well with WA8DED interface/TNC software emulators such as TFPCX etc) with L2PCX and unfortunately most of them object to it. The closest I got was using TSTHOST but I was unable to establish MYCALL :-(I had hoped that the later version of the software may have been more compatible in this regard but it appears not - has anyone had any success with it, and if so what Terminal program are you using with it??

I have tried to send (packet) messages to the author but to no avail, if anyone has his E-mail address I'd be grateful...

Cheers de Luke (ZL2JF).

275. FS: RCA 500/700/1000/TAC200 10M/6M/2M and UHF Mobile Radios (Re-Post)

FS: RCA 500/700/1000/TAC200 10M/6M/2M and UHF Mobile Radios

Plug and Play Commercial FM Mobiles for sale.....
THESE RADIOS WOULD BE GREAT FOR FIXED FREQUENCY PACKET STATIONS!

RCA Series 1000 Low Band Mobile Radio High Split (42-50 Mhz)
FULLY SOLID-STATE 100 Watt Commercial FM Transceiver. 4 Frequency,
Crystal Controlled. Converted to 6 Meter Operation. Tuned to
52.525 MHz (Crystals are seperate, see below).
I have converted many of these radios and they work great.
CONDITION: Very Good. Fully Cheked and operational.
Accessories are seperate (see Below).
Comes with 1 set of Channel Elements.
30 lbs $75
SAME as above but minus covers 20 lbs.....$65

RCA Series 700 and 1000 High Band (148-174 Mhz) Mobile Radios
FULLY SOLID-STATE Commercial FM Transceiver. 4 Frequency, Crystal
Controlled. Converted to 2 Meter Operation. Tuned to 146.52 MHz.
(Crystals not included) I have converted many of these radios and they
work great. This is a cheap way to get on 2 Meters with a very high
quality radio.

RCA SERIES 700 40 Watts,
CONDITION: Execllent , Checked, Fully Operational.
Accessories are seperate (see Below).
25 lbs.....$50
SAME as above but minus covers 20 lbs.....$40

RCA SERIES 1000 100 Watts, High Band.
CONDITION: Very Good. Checked, Fully Operational.
Accessories are seperate (see Below)
30 lbs.....$75
SAME as above but minus covers 25 lbs.....$65

RCA TAC200 Low Band Mobile Radio High Split (42-50 Mhz) 100 Watt transmit.
FULLY SOLID-STATE Commercial FM Transceiver. 6 Frequency, Crystal
Controlled. Can be converted to 6 Meter Operation.
Excellent specs.
CONDITION: Very Good. Complete with Control Head, Microphone, Cable,
1 set of channel elements, and key! (upon request).
25 lbs.....$100

RCA Series 1000 Low Band Mobile Radio Low Split (30-36 Mhz)
FULLY SOLID-STATE 100 Watt Commercial FM Transceiver. 4 Frequency,
with NOISE BLANKER. Crystal Controlled. Currently on 33 MHz.
Can be converted to 10 Meter Operation.
CONDITION: Very Good. Checked, Fully Operational.
Accessories are seperate (see Below).
Comes with 1 set of Channel Elements.
30 lbs.....$75
SAME as above but minus covers 20 lbs.....$65

RCA Series 700 UHF (450-470 MHz) Mobile. 25 Watts FULLY SOLID-STATE
Commercial FM Transceiver, 4 Frequency, Crystal Controlled.
CONDITION: Very Good. Checked and Working. Accessories are
seperate (see Below). With 1 set of Channel Elements on 468 MHz.
Not Checked, SOLD AS IS.
25 lbs.....$50
SAME as above but minus covers 20 lbs.....$40

RCA 500 Low Band (42-50 MHz) Mobile. 100 Watts. Converted to 6 Meter
operation, Tuned to 52.525 MHz (Crystals are seperate, see below).
Solid State Receiver and Exciter (Same circuits as The Series 700 and
1000 radios). Tube driver and final. HAS 2 CHANNEL SCAN CAPABILITY.
THIS IS A VERY CHEAP WAY TO GET A BIG SIGNAL ON 6 METERS!
CONDITION: Very Good, Checked, Fully Operational Complete, Accessories are
Seperate (see Below). With 1 set of Channel Elements.
25 lbs.....$40

RCA 500 UHF (450-470 MHz) Mobile. Solid State Receiver and Exciter
(Same circuits as The Series 700 and 1000 radios). Tube driver and final.
CONDITION: Fair. Looks Complete. With 1 set of Channel Elements.
Have 2 units available. I don't know much about these. Not Checked.
SOLD AS IS!
25 lbs.....$25 ea

ACCESSORIES:
I'm selling accessories for the 500/700/1000's seperate as the supply is
limited.
First Come, First Served!

RCA 500/700/1000 CONTROL HEAD and ACCESSOIRES, 4 Channel,
Very Good Condition Checked. Speaker is built in to head.
Microphone and Cable Included.....$20

RCA 500/700/1000 CONTROL HEAD and ACCESSOIRES, Single Channel
(can be used with any of the above), Very Good Condition Checked.
Speaker is built in to head. Microphone and Cable Included.....$20

RCA 500/700/1000 CONTROL HEAD and ACCESSOIRES, 4 Channel,
Modified for Special System, but works with any of the above radios.
With lights for Freq 1,2,& 3, Speaker is built in to head.
Cable Included. Fair Condition, Checked, Working.....$15

Cable, 4 Channel, Good Condition, Checked, Working.....$5

Set of crystals for 52.525 MHz in Channel Elements calibrated for above 6M radios.....$25

Extra Set of Channel Elements for any of the above.....$5

QC Deck (CTCSS) without vibrosend/sponders, ...$20

RCA Mobile Key.....Free if requested with Radio .....seperate...$5

Replacement Speaker for Control Head, Excellent Condition.....$5

PRICES DO NOT INCLUDE SHIPPING. Send Zip code for shipping estimate.

Can somebody explain to me about the digital 900 mhz spread technology phones offered by Uniden?

They claim the technology came from the military and it can not be scanned compared to regular 900 mhz cordless phones and also 900 mhz analog cordless phones.

Please write us and tell us how the tech works and if this is true.. thanks...

PacComm has licensed the technology. They're currently importing the
German units until they can get domestic production started. I've seen
both the German unit and PacComm's US prototype, so they're real.
The German import is selling for $995. PacComm says the US produced
model will be cheaper here when it reaches market, hopefully this
quarter. AEA has announced that they will support PACTOR II on their
newest DSP box, no release date given. HAL has made happy noises about
doing the same on their P-38 card, again no release date has been
announced. I haven't heard a peep out of Kantronics about this. They're
pushing GTOR and don't seem too interested in other protocols (but
maybe they're doing something on the QT, I'm not privy to their
inner circle.)

282. Help with PcPakratt II software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-16 00:00:00 UTC
From: tloll@news.epix.net
Message-ID: <4detf9$9v1@guava.epix.net>
Source record: 39262

Could someone please tell me if I have overlooked something in reading the manual for PcPakratt II version 5.5a. At present, I am using this software to control a PK-232MBX tnc. Everything seems fine but, I wish I could discover how to keep it from being used as a digipeater. I cannot find the command. In addition, when I turn on the MDIGI I do not see if someone is digipeating through me. I see me rig being activated with the beacon function off. I am new to packet so I may be overlooking the obvious. Any help would be appreciated. Please email to:

tloll@epix.net

Due to a problem with my radio i can't send a message to another amateur via
the ax25 root, and i was wondering if it was possible to send it via tcpip
as he's got an ip address ??

If so, would i just send an email to him e.g. g7ueh.ampr.org ? or would i have
to telnet to his host ? But as i see it this would cause another problem, as
in the uk at lot of machines don't accept connects from none 44. ip addresses,
so if i found a machine that would accept a telnet from me, could i then telnet to his host
?

andy, g7ueh

p.s. is there a list of amateur ip addresses ??

The production version of KaGOLD is a very excellent, user-friendly, etc. etc. etc. product. The testdrive version sucks, however. It has not been updated for years. In addition, it performs all sorts of reconfigurations on your TNC that it does not bother to undo when the 30 minutes is up. Even if you LOVE the testdrive (which I doubt, but you never know), it is unlikely that you will call Interflex up and have a working version of the software in a few minutes, so you may want to use your old software a bit more.

My advice to people who are interested in KaGOLD is to STAY AWAY from the testdrive version and go visit someone who is using the real thing to see all that it can do. The testdrive has probably lost Interflex more customers than it has gained them.

I am interested in getting into radio networking
(packet radio, other types too), but know VERY little
about it generally. I use Linux, and have the HAM-HOWTO,
however I found it of very little use. I suppose if I
hung around this newsgroup long enought I might begin
to pick up on some of these terms, but can anybody tell
me if there is a good book on the subject? One that starts
from the complete novice level and can help a reasonably
inteligent person get up to speed.

BTW, I understand computer networking in general, but
know very little about HAM in general. I am certainly not
a Ham operator (yet). Perhaps I should start with the basics
of Ham Radio operation. That certainly makes sense (guess I
sort of answered my own question). Again though, can anybody
recomend a good book that can get me from complete novice to
reasonably well informed?

I am not much for reading journals until I feel more or less
comfortable with the terminology, but I am sure there are some
good Ham journals. Any recomendations? Are there journals
specific to data communication via radio?

Thanks so much for your response. If you would prefer, please
feel free to respond by private email, and I will summarize the
results and repost them to appropriate usenet groups.

Thanks,
Michael R. Stanley

>of 150 kohms between the output of the op-amp (pin 6) and the inverting
>input (pin 2). Use common low-signal Si diodes, e.g. 1N4148 and use
>a low loss capacitor.

OpAmps in the real-world are not ideal devices, they have problems like offset errors. The output signal is not exactly symmetrical, causing each half-period to be slightly shorter/longer than the next one. As there is no feedback to the inverting input, the opamp runs at maximum gain, driving its output stage into full saturation. This causes additional distortions and for linear circuits it definitely has to be avoided, but the HamComm interface is anything but a linear circuit. And then there is the RS232 line receiver which has its very own idea at what voltage polarity should change.

The asymmetrical nature of the output signal could be easily demonstrated with earlier HamComm versions. Even a pure sine from a tone generator produced two lines in the spectrum display, one above and one below the real frequency. The higher the offset error, the wider the gap. The software was measuring alternating long/short half periods resulting in an alternating tone frequency.

The modification presented by Claude Frantz is an interesting attempt to make the interface self-adjusting by integrating the output signal. However, this approach assumes that the distorted waveform is identical for the positive and negative half-period, which is unlikely, mostly because the supply voltages are neither symmetrical nor stable.

If you look at the spectrum display of HamComm 3.0 you will see that the problem is gone. Apply a sine and you will only get a single line. As it turned out it was much easier to compensate for the offset error in software. No additional components, no adjustments, just a few more lines of code.

HamComm tries to smooth out the signal over several periods. Other programs, especially for FAX/SSTV, may not be able to do the same, as

they required precise frequency information in rapid succession.

RF: The Analog Analysis Program

by Academic Technologies

RF is a new inexpensive circuit simulation sw package for
Windows, Windows 95 and Windows NT. It is primarily
intended for Radio Frequency design but is applicable
to all frequencies.

Come and have a look, visit out Web site at:

http://www.onthenet.com.au/~academic/Welcome.htm

or download the readme.txt and rfdemo.zip demo
version from:

ftp.onthenet.com.au in /pub/acdemic/

or mail us at:

academic@onthenet.com.au

Briefly RF has the following functions:

Tools
Convert between S,Y,Z and ABCD two port parameters
Design Butterworth and Chebichev Filters
Design and analyse coil and wire inductors
Sophisticated Microstrip design and analysis
Design parallel, series resonators and LC filters
Complex/Polar calculator

Compnents
Capacitors (includes parasitics)
Resistors (includes parasitics)
Inductors (Q included)
Curve fitted S parameter devices and whole circuits (fit types:
rational, polynomial, spline, ls, linear)
OpAmps
Transmission Lines (ideal and lossy, open and shorted)
Transformers (ideal and non ideal, leakage inductances and resistances)
FETS (all parasitics)
Tapped Inductors (Q and parasitics)
Beta controlled current sources (all parasitics)
VCCS
Mutual inductors (all parasitics)
Source and Loads
DC source

Analysis Facilities
Swept frequency (Full and Nodal)
Single frequency component tolerance
Swept frequency component tolerance
DC bias point analysis
Pulse analysis (Fourier simulated)

Text Output
Transducer gain
Linvil c stability
Stern k stability
Input impedance
Output impedance
Input admittance
Output admittance
Voltage gain
S11, S12, S21, S22 S parameters
Input reflection coefficient
Output reflection coefficient
Maximum transducer gain possible
Source admittance/impedance to obtain Gtmax
Load admittance/impedance to obtain Gtmax

Graphical Output
Voltage Gain
Transducer gain
Input impedance
Output impedance
S11, S12, S21, S22 S parameters
Input reflection coefficient
Output reflection coefficient
Pulse time trace
Multiple "tagged" plots
Autoscaling or manual scale
Auto cursor tracking (warps to and displays the nearest
points) or absolute
Points or line traces

Stands for Pretty Good Privacy.
Anyone could use your PGP code to encrypt messages but only you can decode
them since this is how it works. You encrypt it with the public code but
you need the personal code to decode it.

From: dick@tmh.ORG
Message-ID: <96011672029@tmh.org>
Source record: 39282

OK, ok ! What is this wonderful magic that will identify me as me
and
is called "PGP" ?!?!?

It sounds great! Could this be the wonderful answer to postage free
QSLing?
Couldn't it be used to prove that a QSO was verified by the true
operator of
the station worked. Such verification would be more indisputable than
a
postcard with someone's call letters printed on it.

I would agree, by the way, that any such "encryption" as "PGP"
involves,
cannot possibly constitute intent to obscure meaning.
... quite the opposite!

But please... What is the method of this wonderfully unique byte or
packet that describes only me. How can Joe Blow take my PGP and
really
be convinced that it comes from none other than yours truly.

So let's not just babble on about whether it's legal or illegal....
Please, WHAT IS IT?? Don't tell me it was published in the Sunday
paper. And please don't tell me it's a bit pattern that someone looks
up
in a directory to see who I am. We have THAT. It's called a "call
sign".

If it's my P-ersonally G-enerated P-attern, what's to keep someone
from
cloning it when I transmit it? Guys who are bent on deception often
will
go to great lengths to deceive.

Feeling stupid,
Dick - W7DHS

How PGP would work in the ham radio context:

You first generate a public/private key pair. These are a string of numbers that work in pairs - anything encrypted in one of them can only be decrypted by the other one. Your public key is widely published so anyone who wants it can get it. The private key you keep very very secret.

Something you send encrypted with your private key can be decrypted by anyone who has your public [presumably, everybody], but ONLY YOU COULD HAVE SENT IT because it was encrypted with your private key.

So you take the checksum (MD5 or something equally trustworthy) of your message, and encrypt that and your signature with your private key and stick that cryptotext on the end of the message.

No meaning is obscured, since none of the text of the message has been encrypted. If the signature block decrypts with your public key, you sent it. If the message checksum from the signature block matches that generated at the recipient, then the message hasn't been tampered with.
- Brian

Message-ID: <1996Jan17.170217.26937@ke4zv.atl.ga.us>
Source record: 39284

In article <96011672029@tmh.org> dick@tmh.ORG (Dick Mock) writes:
>OK, ok ! What is this wonderful magic that will identify me as me
>and is called "PGP" ?!?!?

PGP stands for Pretty Good Privacy. It is a public key encryption system, similar to RSA, or vaguely similar to what your bank uses with your debit card. There are two numbers, a published public number and a private personal number. Any message encoded with the private number as key can be decoded by use of the public published number and vice versa.

Only you know your private number, everyone knows your public number, you publish that. So any message sig that anyone can decrypt with your public number must have been sent by you because it could only have been encrypted by your private number. Thus it can serve as a secure digital signature.

This is done using what's called a "trap door function", IE it works easily one way, but is almost impossible to work the other way. So given your public key, it's nearly impossible for anyone to figure out your private key. Thus forging a signature from you is almost impossible.

The keys are generated from two large relatively prime numbers (say of 100 digits each), and that's mathematically very difficult to reverse. It was once thought to be impossible, but some clever mathematicians now have an algorithm that can sometimes do it given supercomputer resources for a week or so. Thus systems like PGP are secure, but not totally secure against attack by agencies like the NSA, who have the world's largest collection of supercomputers. Still, it offers *Pretty Good* Privacy. There is an encryption system that is totally secure against even the NSA, but it doesn't involve a public key, so it is worthless for secure digital signatures. (That system is the one time pad, and it's completely unbreakable, even theoretically, unless the decoder can gain physical possession of a copy of the pad used for that message.)

Now a person could still forge a plaintext message and append a PGP sig file that they had intercepted from you. That sig would decode properly with your public key. So you have to go a step further than that. If you encrypt the plain text with your private key and append that to the plain text as a sig, that can't be forged since it will be unique for each message you send. It will decode into the exact same plaintext that it is appended to when decrypted with your public key, and *only* with your public key. That completely thwarts forgers without hiding the contents of

your message. The latter is important for amateur radio operators because we can't use encryption to *disguise* meaning, but we can use it to *verify* identification.

Now encrypting plaintext to form a sig is secure, but it is also bulky. There are shortcuts you can take that still offer pretty good security. One shortcut is to sum the ASCII values of all the characters in your plaintext, encrypt that number with your private key, and append it to the message. Now anyone receiving the message can also sum the ASCII values of the plaintext and compare that to the number they get when they decrypt your sig with your public key. If they don't match, there has been either a transmission error, or an attempt at forgery. This isn't as secure as appending the entire plaintext encrypted with your private key, but it is good enough for our routine use, and only adds a very small amount of overhead to our messages. There are other variations on this theme which offer varying degrees of security for varying degrees of overhead.

This simple encrypted checksum technique is an easy way to secure a telecommand link. You don't want the commanded system to respond to a spoofer's transmissions, and you don't want it to respond to one of your commands which has been mangled in transmission. So just sending the encrypted checksum along serves both purposes with very little overhead. It's not very secure, however, since there are only a limited number of possible command strings, and they have to follow a fixed format, so a spoofer could patiently intercept all the possible commands (and their associated encrypted checksums) and still be able to spoof your system. To prevent this sort of attack, you need to resort to a challenge-response verification system.

And BTW, digital signatures can protect *you* when someone attempts to forge a message on the packet network because you can show that the sig doesn't decode correctly with your public key. But *you* can still spoof the network. That is, you can send an offensive message and append a *bogus* digital signature to it. Then you can claim innocence when the vigilantes descend on you. Since the sig doesn't decode, it *must* be a forgery, right? Right, but *you* could be the forger.

One more thing, systems like PGP can be used to disguise meaning too. To do that, you encrypt a secret message to someone using their public key, now only they can decrypt it, using their private key, and the message content is secure against nosy busybodies. We can't do that legally over amateur radio, but it works just dandy over other transmission media, or even as a way to encrypt your own files on your own computer. In that latter case, you'd encrypt the file with your *own* public key, and only you can decrypt it with your private key. (Obviously, never record your private key anywhere it might be found. Memorize it instead.)

Gary

306. Re: Digital Station

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-17 00:00:00 UTC
From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <4dhg04$od7@newshost.lanl.gov>
Source record: 39285

Rarely would I dare disagree with my esteemed Coffman Colleague
from the South.
However, I disagree at least partially with the assertion that
a "C64 + Digicom + HT" is an unsatisfactory minimum packet
setup.
So far as the HT is concerned I agree. But I have extensively
used Digicom and C64's for packet and find them superior, at
least to my packet interests, to other systems. The only
non-digicom/baycom system I've owned was a Kantronics KPC-2 and
it was far inferior to baycom or digicom.
I still keep a digicom station on the air though I rarely mess
with slowpoke packet any more. Digicom, especially my favorite
version 3.51A, has netrom/Kanode-like functions as well as full
CPU and disk drive access, 8-bit I/O outside world outside
access via the userport, etc. The digicom software and modems
even work with less retries etc than many commercial tnc's.
I just think it's neat to be able to access my disk drive, or
change a few memory locations on my home computer, send/receive
email, as well as transfer executable programs and control the
world via a very simple and affordable (and even portable)
computer setup like the C64. Turning on the hall light from
300 miles away via packet radio to let my wife know she had new
email to read was really a turn-on for me for some reason, as
well as commanding the packet setup to switch frequency,
increase or decrease RF power, etc, all from a remote packet
system. Little or none of these features are available from
Baycom nor commercial packet tnc systems, much less at
affordable prices.
Now, this all applies to a PACKET station only. If you desire
to have a "combo" system that will work equally poorly on CW,
AMTOR, RTTY, packet, and SSTV/FAX/ETC then you will either
shell out lotsa bucks for the upper end systems or at least
more than a couple hundred for a low end system.
Now, about those GRAPES systems, I'm fixing to get my feet wet
in those things too, Gary.....

Hi,

73 Amateur Radio published (I think sometime in 1992) an article about
PACKET on the MACINTOSH. It included plans to build a 'poor man's
packet' TNC and references to software for that purpose.

I build the modem
I found the software: - SoftKISS v1.8
- Net/MAC

Is there anyone out there who got this thing working? (I obviously didn't)

The setup receives packets, but it doesn't transmit properly. I
monitered the frequency on an other radio and the transmitted 'bursts'
are consistently short (noticeably shorter than all other packet
traffic). I also noticed that SoftKISS doesn't store the parameters
(like TX_DELAY...).

any help would be appreciated, (any Mac Packet Newsgroups?)

Source record: 39197

The "Rio Grande Valley" covers a lot of territory, all through
New Mexico from north to south.
There is very little personal packet activity north of Las
Cruces nowadays though there still is a considerable amount of
DXcluster activity in the Albuquerque area on 145.03, .05, .07,
and .09.
There is an alternate non-BBS network on 145.03 but it centers
mostly on Central and Southern NM, accessible in some places
from the Rio Grande corridor.
The 145.01 frequency still has many wide area coverage nodes
(ABQW, ABQE, SAM, LAM, are all connectible from Albuquerque and
north in the Rio corridor), but you will find it rare indeed to
catch a "live" packet operator to keyboard with.

re: Getting out HOST mode

Tom:

The TNC is no doubt in HOST mode. Not a big deal, and it doesn't mean that lots of TNC parameters have been changed. If you do a hard reset, it will reset everything back to factory defaults, but You don't need to do a hard reset !! You can exit from HOST mode easily using any terminal program:

Get into your terminal program. Turn off the TNC and turn it on. If you see S00 (that is the letter "S" followed by two zeros) you are in HOST mode. If you see junk, you need to set the program to 4800 baud so that what you send to the TNC can be interpreted correctly. Change the baud rate until you see either S00 (surrounded by FEND characters which look like box corners) or the normal CMD: prompt.

When you can see S00, simply send the TNC "FEND Q FEND" (three characters) to pop it out of HOST mode back to CMD: mode.

HOST mode is the preferred way to run a TNC for a variety of technical reasons, but programs like PAKTERM are not designed for the TNC, they are what is known as "dumb terminal programs" and for good reason as you have discovered.

I suggest you get version 3.0 Also, as mentioned by others, I have found quite a lot of the wide shift (>500 Hz) commercial RTTY is not copied by hamcom, but all the amateur stuff works fine at 45 Baud and 170 Hz shift.

The opamp I use is the TL071 instead of the old 741. You may want to check the supply rails to the opamp during operation to make sure the + and - levels are sufficient at all times. Alos, try swapping the tones. Also, make sure signals are in the centre of the IF pass band. I use a 500 Hz CW filter and tones centered around 800 Hz.

I ran some tests on 2 m simplex FM, and had no trouble running anything other than AMTOR ARQ. The best mode was ASCII 8 bit at 200 Baud. The key-up delay of my HT proved too long for ARQ, you need a pretty fast radio for that. You'll need to listen in on a SITOR ARQ signal to nut out the clock correction as per manual. Mine is -2000 for a 12 MHz 286. I reckon the clock correction is only needed for ARQ, with clockcorr=-2000 the clock counter does not move, however, it does wander on FEC signals but never misses a beat.

I agree it is very nifty software. The best part is the spectrum display, very handy for identifying shifts, and for calibrating the readout of your radio with WWV. As a CW op, I was less impressed with CW, the KAM certainly does that better, but then again, I have yet to see a machine that copies CW properly.

Does anyone know what sort of RTTY is used by those non amateur stations at 850...1000 Hz shift? Also, is there any software that will copy WXFAX with a hamcom style interface?

>
>I don't know to which extend SunOS and LINUX are alike however
>
>As for the old ka9q nos I have no idea if it has been ported to a UNIX
>environment
>

why don't you just use DK5SG's WAMPES? Works much better than JNOS or TNOS
or whatever. It is very relyable and features a lot of nice functions.
The best is: Users who come in via AX25 don't have to mess with the
silly BBS but get a direct shell login. Optionally you can configure
your software to create the shell account automatically the first time
a user logs in.
Do a FTP to ftp.ucsd.edu and look in /pub/hamradio/packet/tcpip/incoming.

I dont know about the next release but I'm interested as well!!
I have a question. My friend and I both use Ver. 6.1, we both here
various beeps from the computer speaker and cannot determine what they
are for. Has anyone else had this happen to them? Also, my friend is
using a panasonic 24 pin printer and cant print from Paket 6.1, It prints
fine however it does not advance the page so it all prints on one line.
Does anyone know why this is? We have both tried to contact Tony (the
programmer) but have not succeeded. I would appreciate any input on the
subject. Thanks in advance!!

>Anyone could use your PGP code to encrypt messages but only you can decode
>them since this is how it works. You encrypt it with the public code but
>you need the personal code to decode it.
>

While this is certainly true, I think Mistie should've gone into a
little more detail to make sure that another unproductive thread about
encryption being illegal on the ham bands doesn't get started.

Besides being used as encryption, PGP can also be used to create
"digital signatures".

The process of "digitally signing" a message (or any file, for that
matter) leaves it as cleartext, but append to it some text which
depends both on (a) the SECRET key in your PGP key pair and (b) the
content of the message you are signing.

Using the PUBLIC key from your PGP key pair, anyone with PGP can
verify that the message you "digitally signed" is the same as the
message they received. If someone along the way has messed with it,
the signature will not match. And it isn't possible for someone to
forge a message with your signature without having access to your
SECRET key.

I am not a cryptographer, so I will not attempt to explain why this
works, but I believe it is dependent on the signature being determined by a
sophisticated hash function.

I'm sure there are errors and omissions in this explanation. You can
find better information, and U.S. users can even download a free copy
of PGP, from

http://web.mit.edu/network/pgp

I can't remember where the non-US distribution sites for PGP are...
ask around on alt.security.pgp or sci.crypt.

Hope this helps.

73,

Mike N1FYO

Well, here I go again, I've been looking for this information for some time now and hopefully SOMEONE has SOMETHING.

I have a few Novatel model 8305A cellular phones that I wish to convert over to 900MHz. They are black, square, about 10" x 10" x 2".

At the very least I need a schematic, but full service information would be nice too. I understand that there was a Novatel Amateur Radio Club at one time and they did just this, converted them over to 900MHz for packet.

Any info would be appreciated and I of course will pay costs of copying and shipping if necessary.

Please reply via e-mail... ka1kjz@ix.netcom.com

From: dj1@prairie.lakes.com
Message-ID: <4dnfkn$18f@News2.Lakes.com>
Source record: 39215

Hello,

I am using a sprint-2 TNC and and an Alinco 1200T radio in an attempt to run some 9600 baud. Everybody can decode me just fine, however my receive seems weak. I can barely decode others signals. I was curious if others were using the same setup and if they had made any jumper changes from the default in the tnc. Or if there were better mods for the radio.

I have the sprint-2 and the tiny-2 with the G3RUH board installed, and with either it just seems that the receive is weak. The others in this project are using 1200T radios with KPC-9612 TNCs. They have better luck connecting with each other, but things just aren't to the point of a useable link.

Thanks for any ideas that you might have....

Jim,

I think we had the "same" experience with Plessey, that's why when
we were looking for a state of the art bipolar foundry for a new RF
chip design, Plessey wasn't considered even though they have one of the
best high frequency bipolar processes available.

I have dabbled a little bit with various NOS versions, but failed to find anything in any of the documentation that differentiates one from the other.

What are the major differences/features of NOS, WNOS, JNOS, and any other NOS that may be floating around out there?

I am now running Windows 95 on my machines with a full fledged TCP/IP network in my home and would like to incorporate packet into this network.

Are there any Windows 95 network drivers around that use a KISS mode TNC and allow TCP/IP packet networking via amateur radio?

If the above is available, then one should be able to set up ftp, telnet, etc. servers under WIndows 95 using standard shareware that would interface to the amateur radio environment.

Anyone done anything like this?

Thanks,
Don - K9GR

346. FS: Kantronics KPC-9612

FS: Kantronics KPC 9612 with box and all papers.
Soldered capacitor to DIN-9 connector with 3.5 millimeter
for mic jack and 2.5 mm for speacker jack on Kenwood
handheld no cover. Also soldered power lug to 9-volt
battery snap. Will ship whole deal or unsolder the
parts for you. Works perfectly. Used only about 1 week.

$180 (includes shipping in continental US)
Will not entertain offers from outside continental US

Hi Gang:

I'm putting together a 9600 baud TCP/IP station. I'm going to use a TEKK data radio. The radio requires a nominal input voltage of 9.6V. (Rang is 7.5 - 12). Does anyone have a circuit that will step 12 volts down to 9.6V? The TEKK is a 2 watt transceiver, and pulls a nominal draw of .5 amps, with peaks up to 1.5.

Any suggestions or references would be greatly appreciated.

Thanks

There is a very good and detailed article on 10 GHz high-speed
digital link by Glenn Elmore, N6GN and Kevin Rowett, N6RCE:
Inexpensive multi megabaud microwave data link; Ham Radio,
December 1989, p. 9-29. This article is based on standard
gunnplexers and IBM PC LAN cards. It seems possible to replace
IBM PC LAN cards with Token Ring cards, either 4 Mb/s or 16 Mb/s,
even Ethernet cards with tranceiver (MAU, thick Ethernet) interface.
Standard software is supposed to run with IBM PC LAN or Token Ring, but
timing problems may occur with unmodified Ethernet software.
This link is for 10 mile hops or shorter distances.

==========

Major "Real-World" Bugging Frequencies

Common Wireless Bugs (Low Power - Well under 35-50 mw)

44.500 - 51.000 mhz "Baby/Room" monitors
72.100 - 75.400 mhz Hearing Assistance systems
54.000 - 150.000 mhz "Kit" Bugs

98.000 - 108.000 mhz Cheap out-of-band FM Bugs
112.000 - 142.000 mhz Cheap out-of-band FM Bugs
140.000 - 160.000 mhz Cheap out-of-band FM Bugs

60.000 - 320.000 mhz Low Cost kit bugs
398.000 - 406.000 mhz DECO Bugs (398.600/605, 399.450/455, 399.025/030, 406mhz)
25.000 - 450.000 mhz European/English Kit Bugs

150.000 - 216.000 mhz Typical VHF "Body Wire" & Pro-Grade Bugs
109.000 - 140.000 mhz Digital VHF Pro-Grade Bugs
138.000 - 174.000 mhz Typical "Spy Shop" & LE Cheap VHF Bugs (155-172 Popular)
140.000 - 150.000 mhz Popular Xandi Flea power kits (143/144mhz)
150.000 - 170.000 mhz Popular Japanese Flea power kits (under 5mw)

150.000 - 220.000 mhz Commercial Wireless Microphones
169.000 - 172.000 mhz 47 CFR 90.265 Authorization *** VERY Popular ***
174.000 - 216.000 mhz 47 CFR 2.106 (NG115) Authorization
395.000 - 410.000 mhz German UHF Wireless Microphones (PK Electronics)
219.000 - 530.000 mhz English UHF Wireless Microphones (300-500 popular)
470.000 - 608.000 mhz Commercial Wireless Microphones
730.000 - 806.000 mhz Commercial Wireless Microphones

889.000 - 960.000 mhz Modified Cordless Phones (S/S & Hoppers)

380.000 - 480.000 mhz Video Bugs - US
890.000 - 960.000 mhz Video Bugs - US (902-928 Hot)
905.000 - 928.000 mhz Video/Audio Consumer Products (i.e.: Recoton)

1.700 - 1.930 ghz Video Bugs - US
2.400 - 2.500 ghz Video Bugs - US *** VERY Popular ***
5.725 - 5.850 ghz Video Bugs - US *** VERY Popular ***

1.100 - 1.400 ghz PAL Video Bugs *Very Hot in
England/France/etc*
2.400 - 2.500 ghz PAL Video Bugs *Very Hot in
England/France/etc*
3.500 - 4.500 ghz PAL Video Bugs *Very Hot in
England/France/etc*

430 - 550 mhz Popular French Video/Audio Bugging System
950 - 2500 mhz Popular French Video/Audio Bugging System
700 - 900 mhz Popular Italian Audio Bugging System

"Tactical" Bugs

225 - 400 mhz "Throw away" bugs (10uw-300mw Beer can bugs)
290 - 330 mhz Micro-powered Bugs (5uw-10mw Cigarette Butt Bugs)

30 - 500 mhz Tactical Repeaters (75mw-300mw)
285 - 400 mhz Tactical Repeaters (50mw-10watts)
100 - 152 mhz VHF Tactical Repeaters (300mw-25watts)
135 - 174 mhz VHF Tactical Repeaters (300mw-25watts)

VLF and Carrier Current Type Bugs

9khz - 490 khz Carrier Current 47 CFR 15.219 Auth (250 microvolts)
490khz - 1.705 mhz Lossy Cable 47 CFR 15.221 Auth (1000 microvolts)
450khz - 30.00 mhz PLA Systems 47 CFR 15.207 Auth (30 mv@ft/30ft)

3 - 200 khz 300 mw High Grade Pro Bugs (over 500$ each)
100 - 200 khz 50-100 mw Older Bugs
120 - 200 khz 30-50 mw Pre 1990 intercoms
200 - 300 khz 30-50 mw Post 1990 intercoms
300 - 400 khz 250-400 mw TELCO Line transmitters (355khz popular)

300hz - 30 khz Cable TV Carrier - Hardwired microphones
30khz -300 khz Cable TV Carrier - Coaxial Bugs

100 - 450 khz Threat Window #1 Most CC Bugs
3khz - 3 mhz Threat Window #2 Expensive "Pro-Grade" Bugs
5khz - 32 mhz Threat Window #3 Popular WJ Carrier Current Rcvr
3khz - 50 mhz Threat Window #4 Realistic Threat Window for Telephone Wire
15mhz - 70 mhz Threat Window #5 Audio/Video "Micro-Wire" RF circuits

WECO Bugs "boosted/ultrasonic audio" found on Power/CATV/Telco lines

64kbps to 1.5mbps Digital Bugs T-Carrier-Lo (T-1 and Below)
1.5mbps to 50mbps Digital Bugs T-Carrier-Hi (T-1 and above)

2.048mbps Digital Bugs Definity Circuit Pack Bug
32mbps Digital Bugs TMS Channel/Backplane bridge
Designed to transmit on CC or Microwave ISM Spread Spectrum (2.4-6.0ghz)

VLF Devices

25khz - 90khz Tape Recorder Bias Osc-Low End (35-45khz Common)
80khz - 145khz Tape Recorder Bias Osc-Mid Range (88.2, 96, 100khz Common)
100khz - 325khz Tape Recorder Bias Osc-Pro Grade (100, 150, 300khz Common)
40khz - 50khz Tape Recorder DAT/Hi8 (44.1/48khz Common)

8khz - 35khz Recorder Audio Servo Noise (10-20khz Common)

7khz - 35khz Video Camera VLF Detectable emmisions
15.750 mhz Common NTSC Video Camera
15.734 mhz CCD/PCB Video Camera (very easy to detect)
15.625 mhz Common Video Camera

Also, be aware of ultrasonic/audio emmisions from most VLF devices.
(Utilize a EOD/Bomb Tech Stethoscope, and Ultrasonic Spectrum Analyser)

Spread Spectrum/Hopping Bugging Frequencies

Legit Industrial Equipment (very inexpensive)
902 mhz - 928 mhz ISM band A (Very Popular)
2400 mhz - 2484 mhz ISM band B (Very Popular)
5725 mhz - 5850 mhz ISM band C
10500 mhz - 10550 mhz ISM band D
24075 mhz - 24250 mhz ISM band E

SS Amateur Radio Bands Often used for eavesdropping (very inexpensive)
50 mhz - 54 mhz 6.00m Amateur Radio Equipment (STA)
144 mhz - 148 mhz 2.00m Amateur Radio Equipment (STA)
222 mhz - 225 mhz 1.25m Amateur Radio Equipment (STA)
420 mhz - 450 mhz 70cm Amateur Radio Equipment (47 USC 97.305)
902 mhz - 928 mhz 33cm Amateur Radio Equipment (47 USC 97.305)
1240 mhz - 1300 mhz 23cm Amateur Radio Equipment (47 USC 97.305)
2300 mhz - 2450 mhz 13cm Amateur Radio Equipment (47 USC 97.305)
3300 mhz - 3500 mhz 9cm Amateur Radio Equipment (47 USC 97.305)
5650 mhz - 5925 mhz 5cm Amateur Radio Equipment (47 USC 97.305)

SS Amateur Radio Bands Occasionally used for eavesdropping
10.00 ghz - 10.50 ghz 3.0cm Amateur Radio Equipment (47 USC 97.305)
24.00 ghz - 24.25 ghz 1.2cm Amateur Radio Equipment (47 USC 97.305)
47.00 ghz - 47.20 ghz 6.0mm Amateur Radio Equipment (47 USC 97.305)

SS Amateur Radio Bands Rarely used for eavesdropping (very expensive)
75.50 ghz - 81.00 ghz 4.0mm Amateur Radio Equipment (47 USC 97.305)
119.98 ghz - 120.02 ghz 2.5mm Amateur Radio Equipment (47 USC 97.305)
142.00 ghz - 149.00 ghz 2.0mm Amateur Radio Equipment (47 USC 97.305)
241.00 ghz - 250.00 ghz 1.0mm Amateur Radio Equipment (47 USC 97.305)
300.00 ghz - Light (3 Thz) Amateur Radio Equipment (47 USC 97.305)

Note: Most commmon spread spectrum/hopping bugging equipment will
hop at speeds
between 100 and 50,000 hops per second. Equipment is readily
available that
hops even faster (100,000 to 300,000 hops per second). Dwell times
can be as small as 1us (one widely used military system uses a dwell
time of 3-5us)

Outband Equipment
ANY Television broadcast or Cable TV frequency
ANY FM radio broadcast frequency
ANY Paging or Beeper frequency
ANY Cellular Telephone frequency

820 mhz - 960 mhz Modified (902-928) Cordless Telephones
Modified Amateur Radio Equipment (can be on ANY frequency)

Keep in mind that wideband (non-ISM) Spread Spectrum/Hopping Bugs
are very
difficult to detect(even if you are within a few feet). Watch for carrier
feed-through, and "Noise Floor Humps".

All Spread Spectrum devices are detectable

Once Spread Spectrum/Hopping Bugs have been located (on the RF
spectrum) all
that can be done is to locate the sourse of the emission... it is
virtually
impossible to demodulate a SS signal unless you have access to the key.

Also, a 500mw ISM device can easily have an effective range of over
20 miles.

Look for spectral anomalies (humps) on the Spectrum Analyzer, and
back up
with a Compressive receiver.

Commonly Used Law Enforcement Bugging Frequencies

37.000 - 952 mhz FCC Surveillance Blanket Authorization

47 CFR 90.19 "Physical surveillance, stakeouts, raids..."
Straight AM/FM, FM-Subcarrier, SSB, Spread Spectrum, and Hoppers.
If encrypted, it usually uses in-band voice inversion or DES.
(Normally well under 2 watts... most under 35-150mw)

148 - 174 mhz
135 - 250 mhz Out-band Wireless Microphone
174 - 216 mhz In-band Wireless Microphone
350 - 440 mhz Common Video Freqs
380 - 930 mhz Wide Band Hoppers
806 - 824 mhz
851 - 869 mhz
905 - 930 mhz Popular Audio/Video Band

1.4 - 1.5 ghz Common Video Freqs
1.7 - 1.9 ghz Common Video Freqs (1.710 - 1.755 REAL Popular at
1/10 watt)
2.4 - 2.5 ghz Common Video Freqs (2.400 - 2.450 REAL Popular)
5.7 - 5.9 ghz Common Video Freqs (5.725 - 5.850 REAL Popular)
8.5 - 10.8 ghz Common Video Freqs

173.075 - LOJACK Auto tracking system beacon (200ms burst every second)

Police Speed Enforcement Radar
10.450 - 10.600 ghz X-Band
11.488 - 11.628 ghz RD Detector
22.976 - 23.256 ghz RD Detector-2nd Harmonic
24.050 - 24.250 ghz X-Band
33.400 - 36.000 ghz Ka-Band
700nm - 1100nm Laser Threat

Electronic Article Suveillance/Anti-Shoplifting Systems
8.10mhz - 9.30mhz Checkpoint (Hi-Q Tags) 8.2mhz Common
57.75khz - 58.75khz Sensormatic (Magnetic) Books, CDs, and Tapes
915mhz and 1830mhz Knogo (Microwave Resonant) Adhesive Labels

25 - 50 mhz "Bumper Beepers" (38 - 47 mhz very popular)
135 - 170 mhz "Bumper Beepers" (150-170 mhz very popular)
450 - 512 mhz "Bumper Beepers"
903 - 904 mhz "Bumper Beepers"
904 - 912 mhz "Bumper Beepers"
918 - 926 mhz "Bumper Beepers"
926 - 927 mhz "Bumper Beepers"

WARNING:
The area between 900 mhz and 6 ghz is EXTREMELY DANGEROUS as
the eavesdropping equipment in that range is inexpensive, low power,
and highly directional.

Additionally, most TSCM people will not check frequencies above
1.0/1.5 ghz or
3 ghz (because the equipment is too expensive for them to buy).

I have seen surveillance video tapes of TSCM inspections where the video
cameras (Watec), microphones (Sony), and microwave RF transmitters (AID -
2.4ghz) were never detected by the inspectors (using 1ghz AVCOM Spectrum
Analyzers).

Surveillance Satellite (TK-Keyhole) Frequencies
Note: Mostly Wideband Spread Spectrum/LPI channels

420mhz - 450mhz
1.2ghz - 1.4ghz
1.7ghz - 1.9ghz (1.76-1.84 real active)
1.9ghz - 2.2ghz (2.115 real active)
4.9ghz - 5.0ghz
7.5ghz - 8.3ghz
10.6ghz - 12.6ghz (11.7-12.2 active)

23.6ghz - 24.0ghz
25.5ghz - 25.7ghz
22.8ghz - 33.5ghz
42.5ghz - 47.0ghz
50.3ghz - 52.4ghz
78.0ghz - 85.5ghz
86.3ghz - 98.3ghz (86-92 real active)

Commonly Used by Federal Agencies for Bugs, Wireless Microphones,
and Body Wires (also 138-220 mhz, and 399-420 mhz, under 25-50 mw).

408.0500 Federal Shared
408.5750 Federal Shared

409.4000 Federal Shared

960-1215mhz Spread Spectrum Systems (Wideband)

Generally Recognized Federal Bug/Spy Bands
Primary - 25-50mhz, 135-175mhz, 225-440mhz, 1710-1950mhz, 8.3-12.5ghz
Secondary - 890mhz-5.50ghz, 7.0-9.5ghz, 10-39.6ghz

Also, Wide Band Frequency Hopping centered on various UHF-TV channels
(ie: 510 or 670 mhz with a hopping width of +/- 25 mhz)

Keep in mind that the federal government can use virtually any
frequency between DC and light.

Band Width Resolution and Filters

Examine the spectrum with the following BW resolutions/filters:

Utilize all BW resolutions/filters between 5hz - 200mhz (depending
on band being checked)

Note: A programmable digital spectrum analyzer should be used!
(1/3/5/10/15/20/25/30/50/75/100/150/200... Sequence is prefered)

BW Res - Usage/Primary Function
100/200 mhz - Resonate Cavity Bugging Devices/SIGINT Devices
125/35/8mhz - Resonate Cavity Bugging Devices/SIGINT Devices

50/20/10mhz - Diplomatic/Intelligence Microwave Bugs
40/20/10mhz - Diplomatic/Intelligence Microwave Bugs

13/16/20mhz - Microwave Wideband
11/12/13mhz - Microwave Wideband
.5/1/2/5mhz - Microwave Wideband (Burst Bugs)
18/26/36mhz - Satellite Wideband (Video)
2/4/6/8 mhz - Microwave Wideband (Video)
3/6/12 mhz - Microwave Wideband (Video) - Common
.5/1/3 mhz - Microwave Wideband (Video/Burst/Pulse)

1.5/.75 khz - Frequency Hopping Bugs - VERY Common
.4/.2/.1khz - Frequency Hopping Bugs - VERY Common
3.2/6.4 khz - Frequency Hopping Bugs - VERY Common
10/20/25khz - Frequency Hopping Bugs - VERY Common
50/75 khz - Frequency Hopping Bugs - VERY Common
100/250 khz - Frequency Hopping Bugs
300/500 khz - Frequency Hopping Bugs
1/2/4/8 mhz - Frequency Hopping Bugs

300/250 khz - Regular Wide Band Broadcast FM
150 khz - Narrowband Broadcast FM Audio, Television Audio
280 khz - Narrowband Broadcast FM Audio, Television Audio

200/150 khz - Commercial Wireless Microphone - High Grade
150/100 khz - Commercial Wireless Microphone - Concert/Broadcast Grade
58/77/84khz - Commercial Wireless Microphone - Typical Body Wire

50/60/75khz - Commercial Wireless Microphone - Typical police device
8/25/50 khz - European/Japanese Industrial Bugging Devices

50/30 khz - Wideband FM two-way communications (ie: Cellular
Telephone)
16/15/6khz - Normal FM two-way communications
3/6/8/12khz - Narrowband Commercial - Voice
1/3.2/6khz - Narrowband (Marine, HF, etc...)

120/9/1 khz - Narrowband (Bias Osc./Video Cameras/SIGINT)
30/750/500hz- Narrowband (Bias Osc./Video Cameras/SIGINT)
56/75/100hz - Narrowband (Bias Osc./Video Cameras/SIGINT)
30/150/200hz- Narrowband (Bias Osc./Video Cameras/SIGINT)
250/300 hz - Narrowband (Bias Osc./Video Cameras/SIGINT)

300/250 hz - Narrowband OOK/FSK/Data, etc...
300/250 hz - Narrowband OOK/FSK/Data, etc...

Subcarrier Detection:

10 - 500 khz - Most Commonly Used Subcarriers
30 - 150 khz - Typical Broadcast FM Subcarrier (FMSubC)
19/27/38 khz - Typical Stereo Broadcast FM Subcarrier (FMSubC)
67 khz - Typical Musicast/Musak Broadcast FM Subcarrier (FMSubC)

2 - 10 mhz - Audio Subcarriers often used with Video (4.2-8 mhz
common)

5khz - 950khz - Realistic Subcarrier Threat (Audio)
1mhz - 15 mhz - Realistic Subcarrier Threat (Video)

Summary (this will catch 99.99% of all Non-Intell/Diplomatic RF bugs)

All TSCM Inspections should include the following frequencies:
(Expect to see less than 10-35 mw maximum at the TX antenna)
(Do not expect the signal to be present for more than 20uS-100uS)

To find RF transmitters a search grid of 15 foot by 15 foot (or
less) should be used.

Also, all phone rooms, riser closets, demarcs, boots, etc. MUST be
checked.

Remember that the microphone/camera can be hundreds of feet away
from the transmitter.

Use a digital spectrum analyzer and a wideband receiver with an analog
10.7/21.4mhz SDU on the IF, dispersions of 100/200/500khz).

RF Spectrum Analysis and monitoring should take place for at least
twelve
solid hours during a regular sweep (72 hours or more is preferred).

To prepare for IPM the spectrum should be evaluated/monitored for at
least four hours prior to the event.

Most non-gvt RF bugs will have a transmit frequency between 9khz
and 6ghz.

The Spectrum Analyzer inspection must cover at least 3khz to 40 ghz

VLF Detection-Audio .3 khz to 100 khz Video Cameras & Tape recorders
VLF Detection-RF 12 khz to 500 khz Video Cameras & Tape recorders
VLF Detection-Audio .3 khz to 150 khz Microphone/Ultrasonic
Chirping

Carrier Current Bugs 3 khz to 50 mhz 99% Voice

RF Bugs-HF 3 khz to 50 mhz 99% Voice
Space RF Bugs-VHF 30 mhz to 300 mhz 10% Video/80% Voice/10% Data
Space RF Bugs-UHF 300 mhz to 900 mhz 25% Video/60% Voice/15% Data

RF Bugs-Microwave1 900 mhz to 3.0 ghz 70% Video/20% Voice/10% Data
RF Bugs-Microwave2 3 ghz to 18.5 ghz 75% Video/15% Voice/10% Data
RF Bugs-Microwave3 18.5 ghz to 40.0 ghz 75% Video/ 5% Voice/20% Data

...and of Course Infrared! (Look for "IR Blooms")

700 - 1100nm Audio Transmitters/Lasers (CF between 880 and 950nm)
750 - 900nm Night Vision Illuminators
900 - 1710nm IR Video Illuminators

Note:
Most military/intelligence and governmental TSCM inspections look
for devices
between 3khz to 50mhz for Carrier Current, 20khz to 40ghz for
regular free
space RF radio devices, and directional microwave devices from
.5ghz to 120ghz.

From: p.illmayer@sno.mts.dec.com
Message-ID: <4dmo33$avo@usenet.pa.dec.com>
Source record: 39231

Hello ALL

I'm located in Sydney Australia and am very interested in setting up internet mail forwarding via a local carrier. I am not a bbs and really don't intend to be but I want to provide a lot of ww mail in and out of Australia.

Ok, here are a couple of facts..
1) My local internet provider is ppp dialup and offers a telnet shell
2) I will forward and receive mail from my local FBB system via 9600 baud uhf link
3) I will dialup once a day for 5 hours which I hope will also provide a conference bridge.

That's where I am at. I gather JNOS ver L supports dialup PPP access and FBB type mail forwarding. Would I be more effective
1) Zipping up all the mail and ftp'g it to a site.
2) Get JNOS to forward the mail a message at a time ???

I'm very serious about this and want to implement the best sollution that will be the most effective. Can I store up the mail daily and then forward it out ???Can someone out there please help as all of the hardware is in place and I want to move on this...

Could you please e-mail me direct so we can get this thing rolling !!. I then would be happy to act as forwarding to as many internet sites as possible within the 5 hours per day.... Also we may want to forward out 7+ files to the rest of the world as it is used extensively here in oz. Does anyone have a comment on this ????

Than..Peter
e-mail:p.illmayer@sno.mts.dec.com

I am reasonably network literate so don't hold back !!l

Hi John,

Just to let you and others know. TAPR has had a Spread Sprectrum Discussion list going for about 8 months now. Please feel free to come over and join the fun. Barry McLarnon, VE3JF, is chair of the SIG.

e-mail listserv@tapr.org

in the message body say:

subscribe ss YourFirstName YourLastName

There should be picked up discussion since the ARRL has filed and TAPR should be filing soon regarding the SS rules.

Cheers - Greg, WD5IVD

353. JNOS and bootp - Does it work?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-20 00:00:00 UTC
From: <>
Message-ID: <4dpkg3$n2q@news.radio.org>
Source record: 39143

Does anyone know if the bootp and bootpd functions
in jnos110i actually work? If so then how should
I configure the system to use the bootp protocol?
So far I've discovered (no thanks the the docs) that
a file named "bootptab" is required with entries
for the remote hosts which use bootp.

I've also discovered and fixed a bug in the
commmand "bootpd host" which incorrectly listed
AX25 as "Pronet".

Now, when a bootp request is received the bootplog file
contains entries which say the request was resolved
but no "no dynamic addresses available". Then the system
goes unstable and crashes.

I'd hoped that my little remote Z80 systems I'm building
could query jnos via bootp to get their IP addresses...

I thing I may be in uncharted waters here. Has anyone
actually used the bootp functions over ax25?

>9600 baud?
>
>Thanks, WB7ASR...

I did the mod listed on page 24 and 25 of the PK-96 manual. It is said
to be from Mike Curtis, WD6EHR. You tap into audio out and the varactor.
Transmit works OK. On receive there's a huge amount of audio rolloff
starting at 2 khz. By 7 khz received audio was 14 db down.

As a next try I'm thinking of using a Motorola MC3357 chip to bypass
the funky hybrid Kenwood used.

Anybody have any luck with the WD6EHR mod?

>key, and append it to the message.

A checksum like this is pretty weak, since it's fairly easy to figure out how to modify the text of a message but keep this checksum the same. That's because addition isn't a "one way function". There are better checksum methods (e.g. MD5) where it's much harder to figure out how to generate a message with the same checksum.

>This simple encrypted checksum technique is an easy way to secure a

There are other ways to detect injected messages, like sequence numbering, and timestamps. Although one could argue that once you put in a method for recovering from missed sequence numbers, it's effectively a challenge-response system.

>And BTW, digital signatures can protect *you* when someone attempts
>to forge a message on the packet network because you can show that

>can still spoof the network. That is, you can send an offensive
>message and append a *bogus* digital signature to it. Then you can
>claim innocence when the vigilantes descend on you.

This is, however, a way for the "first forwarder" to fulfill his responsibilities -- he can demand each user provide a public key to him, and refuse to forward *any* message not signed by the respective private key. Then, once there is a way to secure the forwarding links (cryptographic "signatures" work fine here too) the packet net would be quite secure against such spoofing.

>... as a way to encrypt your own files on your own computer.
>In that latter case, you'd encrypt the file with your *own* public key,

>record your private key anywhere it might be found. Memorize it instead.)

Traditional secret-key crypto works just as well for this, and performs
better. (Even for message transmission, often protocols call for
a unique "session key" to be generated and exchanged via public-key
techniques; the session key is then used with secret-key crypto
to encrypt the rest of the session.

Sure. None are as secure as simply appending the encrypted version of
the entire message of course.

>>This simple encrypted checksum technique is an easy way to secure a
>>telecommand link. [...]

>challenge-response system.

Yep, so you might as well use it from the start if you need that level
of security. I'd suggest that it might be better to simply "sign" each
command with its encrypted version instead. That would increase transmission
bulk, but reduce the number of two-way exchanges required, which could be
valuable in many situations, for example spacecraft control where it is
costly for the spacecraft to issue challenges.

>>And BTW, digital signatures can protect *you* when someone attempts

>"signatures" work fine here too) the packet net would be quite secure
>against such spoofing.

Yeah, but it doesn't get away from first forwarder screening. What Karn
wanted was to avoid that in a modern peer to peer forwarding network.
The FCC seems mired in the user->BBS->BBS->user paradigm. The first
forwarder rules seem to assume that there's a BBS operator present to
do screening of forwarded messages. Modern peer to peer networks don't
have a BBS to act as screen. Each packet of a message can have a different
first forwarder depending moment by moment on network load and topology.
Thus the message may not be present in coherent form at *any* one forwarding
node. So who's the "first forwarder" now? And which one is responsible for
screening the message? It's much better if we can positively identify
the *originator* of the message.

>>... as a way to encrypt your own files on your own computer.

Yeah, secret key crypto works as well here, but you can use the same
crypto system for multiple duties and don't have to remember a number
of different secret keys if you use the public key system for all purposes.
It might not be most efficient, but it is equally as secure. (The only
real security is offered by the one time pad, but that obviously isn't
very practical for routine file encryption on your disk.)

That's good news. But unfortunately, the government seems intent on continuing to enforce the Munitions Control Act against exports of software containing encryption code, even though the code is widely available to anyone who wants it. That's going to impede wide use of digital signatures in communications packages released in the US for worldwide distribution.

Karn has a test case going through the courts now, addressing this issue. He was stopped from releasing for overseas distribution a floppy disk containing the *verbatim* source code for a common encryption scheme copied from a Wily book which the government admits is fully exportable. Seems the government doesn't think foreigners can type. (Actually, I could have stopped that last sentence after the word think.) The government's position seems to be that the law doesn't have to be rational, it just has to be the law. No wonder there is such widescale disrespect for law in this country.

Hi. My dad is a Ham operator, and asked me if there were some inexpensive way to have incoming Morse code automatically translated and displayed on a CRT. Since I know nothing about Ham radio, I thought I'd post here. I'm sure what he wants to do must be possible; don't know about the inexpensive part though. If anyone can help us out I'd appreciate it. I'd prefer that responses be sent in private email, as I usually don't read these groups.

Thanks in advance.

Dick,

PGP is a public key encryption program. It sounds a bit strange but basically, you create two keys. Your secret key is only known to you. Your public key can and should be made available to everyone.

Once I have your public key, I can write a message and encrypt it, WITH YOUR public key. So when I send it, only YOU can decrypt it with your secret key.

I can choose to merely sign a message with my digital signature using PGP. If I do that the message text is in the clear for all to see but the digital signature will appear at the bottom. Using this signature you can tell that I really was the sender and that none of the message has been altered in any way.

So conceivably someone could copy my message and my digital signature but they can't CHANGE anything at all about the message without the digital signature informing the intended receiver that the message has been tampered with.

A good example of this type use would be if I sent you an order for 500 widgets someone couldn't intercept the message and change it to 500,000 widgets! When I try to verify the digital signature it would tell me that this message was not valid...

So that is the deal on PGP. It uses what is known as "strong" encryption, meaning that in order to crack it would require computing power that doesn't exist, yet.

If you are interested, there are numerous websites and usegroups that discuss PGP. There also are many shell programs that make it easier to use. Check out; http://web.mit.edu/network/pgp.html for more info.

In the Configuration menu (ALT-Z), there is a Keyboard MACRO selection
and in that there is a ALERTS settings, if there is any things listed in the
window there, when the program finds one of those strings in the incomming
stream it will ring the bell. The type of sound the bell makes is configurable from
the Comms Windows menu from the Config screen.

You might want to be a little more specific about the printing, is it when you have
logging turned on via the ALT-P? I don't have any problems, but I am using a
Panasonic Laser printer.....

Jack,

It was in Ham Radio, Dec. 1989. Ham Radio was technically oriented,
almost professional level magazine. Some IEEE journal (Antennas and
Propagation amongst others) publish now quite similar articles.
In June 1990, Ham Radio was sold to CQ Magazine and since then, I haven't
heard anything from it. However, Buckmaster Publishing does sell
microfiche copies of Ham Radio. If you have contacts with a ham club,
university library or something similar, may I suggest them to get the
full set March 1968 - June 1990. Not even the oldest issues are fully
out of date, there are many ideas to explore.

I was a subscriber of the printed copy of Ham Radio in 1980's, this my
only connection to that magazine and persons who worked for it.

389. PK232MBX lockup

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-22 00:00:00 UTC
From: Howard Moscovitz <mosc@fast.net>
Message-ID: <3104133B.56A0@fast.net>
Source record: 39092

I will share a bad experience with my PK232MBX.

Using Pactor, my PK would occationally, maybe every 1/2 hour,
go into the ERROR state (error lite on constantly). It will go
into that state even when there is a very strong signal. It will
not go out of that locked-up state until there is a disconnect
caused by manual intervention, or by timeout. Then a reconnect will
work very well.

I called AEA, and the technician said it sounded like RF was getting
into the box. After checking out my setup, I verified all connections
were equipped with torroidal chokes, except one which is connected
to my VHF rig. I pulled this lead off of the PK232, and the problem
was solved, apparently.

Has anyone else observed the PK232MBX to be so RF sensitive?

Thanks,
Robert.
or email: kaminsr@vax.sbu.ac.uk

> param ax0 dtr 1
> param ax0 rts 1
Have tried that, doesn't help.
In the NOS FAQ says only need TD RD and ground.
Perhaps is incorrect order of statements in autoexec.net ?
Maybe need to somehow tell PC to be a server, so when the other
tries to connect it responds, at the moment is nothing on line,
except when doing the tip command ?

395. PLEASE HELP: Radio Design for Severely Handicapped

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-22 00:00:00 UTC
From: saw@acpub.duke.edu
Message-ID: <saw-2101962031430001@homer.egr.duke.edu>
Source record: 39172
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.shortwave

We are interested in designing/acquiring/modifying a radio (digital?) for use by a severely handicapped individual who was a student before a terrible accident. Only breath-control is practical in this situation. Control of power and tuning are obviously the essential functions needed. We do not want to reinvent the wheel, and are wondering whether anyone has already designed such a radio/interface. I'd be pleased to hear from anyone on this subject, before we start from scratch. The idea here is simply to allow this individual to surf the radio waves, shortwave and other, since disability prevents other activity.

Thanks very much for any assistance.

Very truly yours,

Seth Watkins

John,

Of course inexpensive is comparative, but you should be able to find an XT or 286 PC with monochrome monitor for under $100.

There are 2 or 3 at least shareware programs that are a $10-20 registration that will do this fairly well. The first that comes to mind is the PRO-CW, at least I think that was the one, it included a schematic for the interface also. I played with it for a while, and it worked if someone had a clean fist or sent with a keyboard. I probably still have it somewhere if you can't find it anywhere else. I also think it is on the QRZ CD or home page also.

Good Luck

Re-Post......Here's what's left.

Plug and Play Commercial FM Mobiles for sale.....
THESE RADIOS WOULD BE GREAT FOR FIXED FREQUENCY PACKET STATIONS!

RCA Series 1000 Low Band Mobile Radio High Split (42-50 Mhz)
FULLY SOLID-STATE 100 Watt Commercial FM Transceiver. 4 Frequency,
Crystal Controlled. Converted to 6 Meter Operation. Tuned to
52.525 MHz (Crystals are seperate, see below).
I have converted many of these radios and they work great.
CONDITION: Very Good. Fully Cheked and operational.
Accessories are seperate (see Below).
Comes with 1 set of Channel Elements.
30 lbs $75
SAME as above but minus covers 20 lbs.....$65

RCA Series 700 UHF (450-470 MHz) Mobile. 25 Watts FULLY SOLID-STATE
Commercial FM Transceiver, 4 Frequency, Crystal Controlled.
CONDITION: Very Good. Checked and Working. Accessories are
seperate (see Below). With 1 set of Channel Elements on 468 MHz.
Not Checked, SOLD AS IS.
25 lbs.....$60
SAME as above but minus covers 20 lbs.....$50

RCA 500 Low Band (42-50 MHz) Mobile. 100 Watts. Converted to 6 Meter
operation, Tuned to 52.525 MHz (Crystals are seperate, see below).
Solid State Receiver and Exciter (Same circuits as The Series 700 and
1000 radios). Tube driver and final. HAS 2 CHANNEL SCAN CAPABILITY.
THIS IS A VERY CHEAP WAY TO GET A BIG SIGNAL ON 6 METERS!
CONDITION: Very Good, Checked, Fully Operational Complete, Accessories are
Seperate (see Below). With 1 set of Channel Elements.
25 lbs.....$40

RCA 500 UHF (450-470 MHz) Mobile. Solid State Receiver and Exciter
(Same circuits as The Series 700 and 1000 radios). Tube driver and final.
CONDITION: Fair. Looks Complete. With 1 set of Channel Elements.
Have 2 units available. I don't know much about these. Not Checked.
SOLD AS IS!
25 lbs.....$25 ea

RCA TAC200 Low Band Mobile Radio High Split (42-50 Mhz) 100 Watt transmit.
FULLY SOLID-STATE Commercial FM Transceiver. 6 Frequency, Crystal
Controlled. Can be converted to 6 Meter Operation.

Excellent specs.
CONDITION: Very Good. Complete with Control Head, Microphone, Cable,
1 set of channel elements, and key! (upon request).
25 lbs.....$100

ACCESSORIES:
I'm selling accessories for the 500/700/1000's seperate as the supply is
limited.
First Come, First Served!

RCA 500/700/1000 CONTROL HEAD and ACCESSOIRES, Single Channel
(can be used with any of the above), Very Good Condition Checked.
Speaker is built in to head. Microphone and Cable Included.....$20

RCA 500/700/1000 CONTROL HEAD and ACCESSOIRES, 4 Channel,
Modified for Special System, but works with any of the above radios.
With lights for Freq 1,2,& 3, Speaker is built in to head.
Cable Included. Fair Condition, Checked, Working.....$15

Cable, 4 Channel, Good Condition, Checked, Working.....$5

Set of crystals for 52.525 MHz in Channel Elements calibrated for
RCA 500 or 1000 6M radio.....$25

Extra Set of Channel Elements for any of the above.....$5

QC Deck (CTCSS) without vibrosend/sponders, ...$20

Replacement Speaker for Control Head, Excellent Condition.....$5

PRICES DO NOT INCLUDE SHIPPING. Send Zip code for shipping estimate.

I picked up a Zenith Supersport 386sx laptop (ugh it is heavy!)
for use in mobile APRS. I keep having trouble with the power
sentry powering it down after 10 t0 20 minutes even when I am
running 13.8v directly to the power jack (Zenith says not to do
that but to go thru the battery pack - but that shuts it down
even faster). Anyone know how to disable the auto-power off
feature, I dont need it anyway since my use is strictly mobile
with this beast. Also, anyone have any experience changing
(upgrading) the hard drive, have been told it is IDE but also
heard it has a propriatary connector es bus. Thanks for the
help.

Sure! Just about any terminal software with work, such as ProComm.
There are lots of shareware packet programs available that will work
a lot better than the MFJ junk. LanLink is real good if you use AMTOR.
PaKet is a nice packet/mailbox/mini-bbs program. YAPP is a convenient
little program that will run off a floppy disk. These are all avail
on most ham radio BBS's and FTP sites.

Anything that works with the C64 can be used with the 128 (in
64 mode). This thus includes all the standard terminal
communications programs (which are all you need to interface
successfully to a commercial packet TNC) as well as the DIGICOM
series of packet TNC "emulators" that allow full featured
packet operation using only relatively inexpensive simple
modems to interface the computer to the radio.
You can ftp my favorite version of this software (digicom
V3.51A) by browsing my website at:
http://nis-www.lanl.gov/~jdport/
or ftp to sstcx1.lanl.gov/pub/packet
As well as a few other sites I can't remember the paths to at
the moment.....

Be wary of some of the so-called "9600 mods" floating around. Some were written by people who just looked at the schematic, found the discriminator output and varactor diode, and said "this will work" without ever trying it.

I have a Kenwood TW-4000 and tried the 9600 mod shown in the AEA PK-96 manual. Pretty standard stuff. Just tap into the discriminator output and varactor. Turns out Kenwood used a funky hybrid module for receive that has built-in audio rolloff above 2 khz. Also a built-in series cap that cuts low frequency response. It seriously mangles the signal before you have a chance to do anything with it.

While doing some packet surfing I stumbled across a BBS that had a big list of 9600 mods, including a more complete version of the TW-4000 mod. The author mentioned that the schematic looked OK for 9600 work, and requested that anyone who tried it contact him with the results.

AEA kindly left out any mention of "I didn't try this myself" in their documentation. I wasted a bunch of time on the TW-4000 until thinking to check audio response.

Moral of the story: Don't believe everything you read about 9600 mods. Try to find someone who actually got it to work (or not work).

Message-ID: <DLnEvG.Jw1@sunsrvr6.cci.com>
Source record: 39099

What's a good way to measure the time delay from triggering push-to-talk to RF output on a transceiver? I've seen people complain about 9600-ready rigs that were unsuitable due to slow T-R switching.

I was thinking of sending the push-to-talk signal to one channel of a oscilloscope and using the other to check for an RF signal. But this doesn't check for a wholesome and on-frequency RF signal with the transmitter first keys up. Any ideas?

Hi Gang:

I'm in the process of converting my ethernet based LAN to use my block of Amateur Radio IP addresses assigned to me by my local coordinator. I'm planning on dedicating one of my PCs to act as a gateway between the ethernat LAN and the radio. The PC I tend to use is an NCR 386 DX which is MicroChannel based, (IBM PS/2 compatible). I wil drive the TNC and radio through the serial port, and connect to the rest of the LAN via a Western Digital ethernet adapter. I have poured through the doco on JNOS and have not found any info on whether or not JNOS can talk to MicroChannel Ethernet adapters.

Is anyone running a JNOS gateway on a MicroChannel machine? If so, is there anything I need to be aware of? Any hints or suggestions would be greatly appreciated.

Thanks!

>and uses a separate machine (his old DOS machine) running NET to do
>the AX.25 handling. Just set it up as a router and you can do TCP/IP
>using the standard Win95 stuff. (and Netscape etc)

AND! That's the best way to do it!

You could also dedicate a serial port (SLIP) link if you can't afford
ethernet (ethernet is about 50 bucks a card). But JNOS 1.10m is the
state of the art. There are others, but in my opinion: they are crap.
TNOS is crap, Linux AX.25 Kernel is crap, etc. The best debugged
model is JNOS 1.10m. Get it from:

ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming

Shut off all the bullshit (there's a bunch of dumb stuff in there), and
you have a great system for the low baud rate stuff. As you get up
in speed (56k) you can just drop all the AX.25 crap and go direct VFR.

An IBM XT clone is overkill in this application, a 286 is a screamer :-)

>How can I get more memory availble?

How much memory do you have available before starting JNOS?
Depending on options, JNOS typically requires between 400 and
500Kbytes. If you are running anything else, try loading it in upper
memory if possible. Even running emm386 with dos=high in config.sys
helps. Also, there are some tips in the JNOS readme.now file about
making some of the video memory available, giving 704 to 736k total
DOS memory. If you have options compiled in which you do not use,
they take up memory also, so you should compile (or get someone with a
BC compiler to compile for you) a version with only those features you
want. Fortunately(?) BC will bomb if you try to compile in too many
of the options. It has been my observation that with around 200K
available core after starting JNOS, operation is pretty stable. Much
less than 70K or so is asking for problems. It is quite normal for
the available core to go up and down a bit (some earlier versions
would only drop memory!)

I have two of the veritable beasts. As I recall from the tech specs from years ago, they are NOT 13.8 volts, but slightly MORE. The power pack that comes with them that feeds the battery pack and the unit is higher by a little or so than the 13.8 volts. What I think is happening is that you are discovering that the shutdown ahppens when the unit finally decides that the final line voltage in the unit is too low after some of the in-line resistance has gotten nice and hot. Poof - undervoltage sense.

I could be wrong. I think I asked Pat a ZDS engineer up in Dallas one time about using them for mobile service and he told me it would never work, in the long un, off a 13.8 volt line. I wanted to do the same thing you are trying to do and he told me get a DC to AC converter and bring it back down to the ZDS external power cube, then to the box. No workee elsewise.

The internal drive is a CONNER drive, if my memory is right. There is an 80 MB drive I recall can be substituted in them from CONNER. You have to be careful, because all CONNER drives are not created equal. You THINK they are. Recall the story about the two bumble bees that flew into an EXXON station for fuel. One hung near the regular pump, one near the the extra pump. The attendant was wiping the feelers of the bee at the regular pump and asked, "I don't understand, you look a like, buzz alike, take on fuel alike, why are you here and he is there?" The bee replied, "I am a regular bee, he is an Esso bee." Bee careful.

Henry Fale, now deceased, may he rest in peace, published the trade rag HSCOOP for ZDS faithful for years. In one of the articles in them several years back was the complete procedure for trading out your 40MB drive for the 80MB version. It had all the regular bee part numbers and the Esso bee part numbers for you.

I have found that these units WILL tolerate MS DOS 6.2x and WILL remain stable with the MS version of DISK TROUBLER, pun intended. Further, they can be used with QEMM version 7.4 or so with that disk compressor to get you some help on hard disk size.

The unit may be heavy, but outside of the problem of the flex cable getting stress riser cracks where the case lid folds, they are VERY good products.

There are at present dozens of radio teletype systems on the air other
than standard Baudot ('RTTY') or ASCII. I have no experience with
hardware decoders, such as the models produced by Universal. Over the
past years I've been using the 'Code 3' software, developed in the
Netherlands and widely available in Europe. It's easy to use and includes
dozens of modes and several useful signal analysis tools. It also
tells you automatically what system you are receiving.
Only problem is PC-generated interference (which you wouldn't have with a
hardware decoder); the advantage is that received signals and messages
can be automatically stored on your hard disk for later reference.

Thanks, Jeff,

Very good! So what appears above is your (tampered with) PGP
message... and signature!!! (Pretty long signature, Jeff)
So now no one really believes that you actually wrote those words, HI
HI.
And I am publicly stating that I tampered with them, so maybe I won't
be
prosecuted so harshly... maybe.

Hopefully, for me, you won't bring damage charges upon me.
(Also, Jeff, I have very shallow pockets.)

Sounds like PGP has a wider discussion than I had realized. But from
the responses to my cry, it seems to be a solution fraught with
frustrations for ham radio applications, not the least of which is
the bugaboo word: "encryption."

Now that I can cast an informed vote, I submit that when encryption
is applied in this manner, (that is, to IMPROVE message validity for
potentially ALL readers) there is no way that it can be construed to
carry "intent to obscure meaning."

But that is just one hurdle. Others seem to include the establishment

of an accessible public storage of "public keys." ... a reliable
and trustworthy authority who wants the job without pecuniary
interest. (How about them apples?) 'course, I guess only those who
WANT to verify their messages need the public keys. Perhaps we
can apply this properly by assuring that we do include our true
identity in the clear text portion as well as the encrypted portion.

I hope we can do this without nickel and diming our hobby even
further.
We already pay ever-increasing postage for QSL cards. (Also, using
the
Postal Service, a commercial enterprize, is "not ham radio"
.... tongue-in-cheek). I'm looking for digital solutions to reverse
this.

While I have put some additional information, some about running full duplex, on the page mentioned, it really isn't a replacement for the original article.

Recent copies of the ARRL Radio Handbook and "Packet, Speed Speed and More Speed" publications have included the RF portions of the original article.

However, as far as I know, the original article in its entirety has never been republished.

I miss Ham Radio Magazine too. I appreciated and enjoyed reading it.

Source record: 38992

Hi,
I've recently installed Linux on my PC and I'm interested in using
this OS for packet (AX25 & TCP/IP).

The HAM-HOWTO says to switch a TNC into KISS mode. However, I
dont have a TNC and I don't really see the point in buying one only
to switch off most of its functionality.

My question therefore is: Would it be possible to use a Baycom style
modem instead of an expensive TNC ? Or how about some kind of
adaptor for an external phone modem ?

Any help gratefully rx'd. (By Email please).

Try taking the output from the discriminator of a receiver tuned to the same channel for the second scope trace. Use a shielded dummy load on both TX and RX.

> 73..Jim N2VNO

An oscilloscope is an easy way to do it - looking on one trace at the
PTT line going high and on the second channel looking at the RF - then
just measuring the delta T (time difference).

>
>Has anyone else observed the PK232MBX to be so RF sensitive?
>
> --Howard

If the TNC is going into "ERROR" state (and I am guessing that this is happening in Pactor. One of a few conditions may be happening. The link has truly gone into a link error that it can not recover from or 2) you are using the early version of PK232 pactor firmware, in the first release of the PK232 Pactor firmware it was possible to have the TNC go into ERROR state while linked by issuing a TCLEAR (clear the contents of the TNC xmit buffer) to the TNC. This was corrected in a later release of the firmware.

One other possibility is that you or the other station have an incorrect ADELAY setting. This should normally be in the range of 4 or 5 (maybe higher if the two stations are extremely close).

I had a similar experience with the HAL PCI4000M. I could not maintain a link. After making a change to that systems CS Delay parameter it virtually eliminated the problem.

I realize that the above do not answer the question of removing the VHF connection solving the problem. You may have a cross-talk problem with the PK232 (I have seen that at this QTH).

Hope the information is of some use.

I'm looking for some suggestions...Please!

Recently I have installed my packet software on another computer. I have encountered one problem. The Astron power supply, which is only about 6 months old, interferes with the computer. The power supply causes the monitor image to waiver.

I have two other computers and monitors in the same room, using the same 100 power source (They don't all run at the same time!). The power supply does not interefere with the other two computers.

Any suggestions on where I begin to shield and filter to prevent this problem.

Thanks for any help!

Source record: 39127

Hello group,

I have been trying to get a couple of Arcnet cards working for about a month now without success. I posted several times but did not get many responses. I decided that maybe these cards were not very popular. I saw a few messages from people using ne2000 cards with success so I bought a pair.

I have Wnos/Jnos running in a 286 and Windows 95 in a 486. I am using the ne2000 driver from Crynwr, Winpkt and Trumpet Winsock. I have been using this setup for a few years in Win3.1 (Using slip mode thru the com ports). The cards are talking to each other, leds are flashing but I get no connections. Trumpet trace says 'Unknown TCP'.

I will eventually use the Win95 tcp/ip but would like to get the link working first with trumpet since I know that setup is working in slip.

Can anyone guide me to the next step ?.. What test should I do next..

Thanks in advance.

Jean-Pierre.

It is easier to find 7808 regulators than 7809's. Insulate the tab from ground and put N ordinary silicon diodes in series with the center lead to ground. For each of the N diodes, the output voltage will go up by 0.6 volts (the conduction drop for a silicon junction). This will also work with easy-to-obtain 7805's also, but it takes 5 more diodes. A red LED will give you about 1.2 volts extra and a green LED will give you about 1.8 volts. Using a LED also gives you a free pilot light!

>to switch off most of its functionality.
>
>My question therefore is: Would it be possible to use a Baycom style
>modem instead of an expensive TNC ? Or how about some kind of
>adaptor for an external phone modem ?

Nope, you can't use a simple baycom-style modem since there's no driver
for it. Even if there was I wouldn't recommend it since it eats a lot
of processor power away. Of course buying a TNC is - as you said - not
very sensible. I think the best solution would be to buy a baycom SCC card.
As far as I know you sould be able to get them (the 2-port-version) for
< $80. You can also build them yourself. There's an excellend SCC driver
by dl1bke/pe1ayx in the alpha kernels (1.3.x).
You can use these drivers with the kernel AX25 stuff but also with the
very popular WAMPES program.

>they would allow me to photo-copy.

The 1274 is pretty much a clone of the TAPR TNC-2, and the MFJ
1270/1274 manual was copied in most part from the TAPR documentation.
You can get a copy of updated (for 1.1.8) TAPR documentation from
ftp.tapr.org in /tapr/software_lib/tnc/tncdocs.exe. Sorry, it does
not include a schematic.

This crops up from time to time. L.L. Grace is indeed producing
the KCT and KCT/T boards. They have dropped the DSP-12 product
which, I suspect, lead to these rumors.

If L.L. Grace di go out of the KCT business I expect someone else
would pick it up as it is the defacto standard of the amateur
satellites.

466. Packet Radio and the Internet

I have not been involved with ham radio for close to 10 years now. I left off with packet radio in its' infancy on 2 meter. Could someone please update me on where packet radio is at today, expecially with regards to:

1. Does packet radio use a graphical interface with the internet?
2. What are the speeds of the modems?
3. Is packet able to keep up with the 28.8 modems or faster?
4. What would be the advantage(s) if any to accessing the internet with packet radio as opposed to PC's through phone lines?

Thanks,

Gene Zalar, KA8ZUZ

>An oscilloscope is an easy way to do it - looking on one trace at the
>PTT line going high and on the second channel looking at the RF - then
>just measuring the delta T (time difference).

Keep in mind the delay from PTT to RF is not the only factor in determining
the necessary TXDelay value. Look at the audio output of a monitor receiver
to see the actual audio; some radios will start producing RF pretty quickly,
but time constants in the modulation chain can introduce significant delay.
I once heard a station on the air that took probably 500mS for the audio
to "fade in"; he could connect to local stations easily (because the
signal/noise ratio was good) but distant stations required a much
longer TXD.

I'd say look at both RF and received audio.

Source record: 39000

Fame, Fortune (Maybe), Big Science: All Free!:

For some months we've been running tests of throughput
in the HF TOR and packet modes over NVIS links in New England.
(See the Packet Perspectives column in February's QST.)
The tests, which also measure other things, are
completely automatic (connect, login, file upload to KAM BBS,
logout, disconnect), so receiving operators don't have to do
any real work or even be at their terminals.

We have recently expanded these tests to long-haul links
(500-1000 miles), and want to do more of that while distributing
the load and getting more variety.

What we need:

Stations in the SE US (say between the lines from Boston to Texas
and Boston to Florida), anywhere from 300 to 1500 miles from Boston.
(We'll gladly try other links, but with our antennas pointing south
and SW, these are the best bet.)

The stations need to be equipped with Kantronics KAMs that can run GTOR.

They need to have antennas that have a reasonable chance of
communicating with New England (beams nice, but omnis work fine).

Freqs will probably be 30m, 20m, maybe 17m, during the day,
80m, maybe 40m, at night.

What you need to do:

1. Leave your rig on agreed-upon frequencies at agreed-upon times
2, Leave your KAM in TOR STANDBY, in BBS mode (if PC is off), with your
ARQBBS ON (for TOR measurements)
Or in command mode (for packet measurements)
3. Empty your PBBS when it's full (every coupla days, at most)

(Added bonus: you get to read fascinating, informative messages
over and over and over.)

If fame, fortune and hard science are your goals,
gimme (KB1JY) a shout at kwick@mitre.org
(Any pubs will mention you prominently.)

Hello friends !!

First of all, thanks for reading this message. I'm a 20 year old student of Telecomunications Engineering, now I'm ending my last year in the university and I've got to make a project to get my graduation. I wish to do the project in a foreign company, and so I write you to ask for any company or research centre where I can do it. My target is to get a place to do it and then apply for a Leonardo European Comunity 'beca'. So, for the European Comunity will give me some money, I don't want the company to p
ay me much money (but some). About the schedule, I'm interested in starting after July and to work there for 6 or 9 months aprox. The area I would want to work obviously is Radio, Digital Links, Electronic Design, ... or technical software programmer.

Maybe, this is not the plae to put my message someone may think, then sorry, but I think that it is a way to communicate between hams, and to get contact with people working in this area.

Then, please, if you know any address of possible interested companies or you work in any Research Group, or, if you know anything that would interest me, please write to me.

P.D.: I know english, german, spanish, catalan and some french.

THANKS IN ADVANCE !!!!!!!!

D*mn, I was wondering why the "Speed, Speed" reprint seemed so skimpy.
I couldn't believe it didn't provide any information about getting
the resultant bitstream into a computer.

If someone would like to snail-mail me a photocopy of the original
article, I will scan, OCR, and HTMLize it for hosting on the Web
server of anyone who would like to host it. Email me first so I know
it's coming.

Alternatively, if someone will also donate me a machine and a backbone
connection I will set up a Web server and put the article up myself. :)

You need to measure to delay from PTT to DCD at the receiving modem.
One scope probe hooks to the PTT line on the transmiting modem and
the other to DCD on the receiving modem. Then, connect a low frequency
square wave generator up to PTT so it gets keyed on and off at a steady
rate. The scope should be set to sync on only the leading edge of PTT.

I used this method to measure the PTT to DCD delay on the 56k modems
I've been designing. The number I got for them was 3 to 5 milliseconds.

: >or packet: wi0e@wb0gdb.#msp.mn.usa.noam . thanks!-steve, wi0e

: Be wary of some of the so-called "9600 mods" floating around. Some were
: written by people who just looked at the schematic, found the discriminator
: output and varactor diode, and said "this will work" without ever trying it.

: I have a Kenwood TW-4000 and tried the 9600 mod shown in the AEA PK-96
: manual. Pretty standard stuff. Just tap into the discriminator output
: and varactor. Turns out Kenwood used a funky hybrid module for receive
: that has built-in audio rolloff above 2 khz. Also a built-in series cap
: that cuts low frequency response. It seriously mangles the signal before
: you have a chance to do anything with it.

: While doing some packet surfing I stumbled across a BBS that had a big
: list of 9600 mods, including a more complete version of the TW-4000 mod. The
: author mentioned that the schematic looked OK for 9600 work, and requested
: that anyone who tried it contact him with the results.

: AEA kindly left out any mention of "I didn't try this myself" in their
: documentation. I wasted a bunch of time on the TW-4000 until thinking to
: check audio response.

: Moral of the story: Don't believe everything you read about 9600 mods.
: Try to find someone who actually got it to work (or not work).

: 73..Jim N2VNO
: jdc@cci.com

Most people connect the modem to the modulator/disciminator, and try to
connect to the local bbs. If they get the connect prompt, they yell "IT
WORKS!" without looking any further.

The bit error rates, as published in the recent QST articles are a big
improvement. But most amateurs don't take the trouble of doing these tests.

Joop

Mark and Keith Sproul should have a Windows version of APRS available at Dayton. They will be at the TAPR booth doing their thing -- so if you are attending Dayton later this yera, plan on stopping by the TAPR booth. You can keep track of the updates regarding the windows version of software as well as about everything related to APRS on the aprs SIG on tapr.org. You can send e-mail to listserv@tapr.org and in the message body say subscribe aprssig YourFirstName YourLastName.

There should be lots of APRS stuff happening at the TAPR Digital Forum and PacketBash at Dayton. Probably a SIG meeting on Friday after the Digital Forum at the convention. Then I know there is another meeting on Saturday evening. There should be APRS stuff happening at the PacketBash on Friday evening as well.

Cheers - Greg, WD5IVD

482. problems in Packet Radio..???? Solution, now!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-25 00:00:00 UTC
From: coyote@lleida.net
Message-ID: <4e92q6$lsm@minerva.ibernet.es>
Source record: 39012

If do you have problems with packet-radio, you have one solution downloading the file "TALION18.ARJ" in
FTP.FUNET.FI/HAM/PACKET/TERMINAL.

The problems are over.

If do you have any sugestion, please mail me.

Thanks....

This may be a silly question, I want to compile some different options into JNOS. I've got the source code, a C compiler (borland c++ 3.1 (I think)), I was told to edit the config.h (or was it .c) file. But when I try to compile it (or make it) I get a linker error in a0.asm. Can any one help ??

Hi Les,
as far as I know Baycom doesn't work on any multitasking system at all.
Cuz of work is done on the PC it calls for the undevided attention of
your computer. This can't be provided by a multi-tasking OS.

489. ROUTES UTILITY packet tracker

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-25 00:00:00 UTC
From: Orrin Winton WN1Z <orrin@redshift.com>
Message-ID: <31082E9A.118@redshift.com>
Source record: 39019

I'm making available a program i wrote, ROUTES. Details on how to get it FTP are in my web page below.

Basically the program extracts routing information from packet headers (that you've downloaded with the RH command, or V in fbb) and can be used to produce a database of who forwards to whom, with delays in forwarding recorded. More details on my web page.

It is named Kantronics because they are in Kansas. The
confusion above is because the make a TNC called a KAM. That
stands for Kantronics All Mode.

>in the users machines are appropriate, etc.....

Our organization has had a 9600 baud digital repeater operating in the Denver area for the last 14 months. This repeater supports the Northeast Colorado TCP/IP Backbone. 4 Megabytes a day are being transfered thru the repeater.

The repeater is built from a 25-watt UHF Motorola Micor modified for duplex and 9600 baud data, a TAPR 9600 baud modem, an MFJ-1270B TNC just used as an IDer, and the usual repeater stuff (duplexer, second harmonic filter, control receiver, DTMF controller, feedline, antenna). BTW, I have full modification instructions available for the UHF Micor.

We operate the user stations with a TxD of 150 milliseconds. Retries are very low because all the user stations can hear each other -- NO hidden transmitters!

Some info is available at http://www.rmsd.com/hamradio/dwg.html. Ask me questions if you don't find the info you need!

496. Looking for plans for transceiver for packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-26 00:00:00 UTC
From: David Negaard <draagen@connectnet.com>
Message-ID: <3108FA94.45413253@connectnet.com>
Source record: 39026

I'm looking for plans for a simple (probably crystal-controlled)
transceiver that would be suitable for 9600 bps packet use. Does anyone
know where I might obtain same?

My hand-held won't cut it, of course (PM instead of true FM), and I
can't really afford to buy another radio right now.

Also, I assume that a radio suitable for 9600 bps would also function
admirably at 1200?

You can use a copy of THS put out by HB9CVV, Pete, to drive either the
AEA series of TNC's which he uses, or the 8DED stuff as well.

The earlier version of the program PHS-250 didn't work well for me in
OS/2 but the THS-650 or THS-850, I can;t recall which at the moment,
DID work and works VERY well.

I was even able to use it well with the AEA PK-900, but I found I had to
set it up so that it did NOT re-initialize the thing on start up quite the
way it was suggested.

It also does not hold the buffer up for inbound stuff on exit so that you can
read all the stuff that has happened when it was shut down like the AEA
program.

If all you want is ONE comm port program going, there is nothing wrong with
using the later version of the AEA PPWIN program as a DOS VDM session
program. With SIO.153 and OSTSR to gain control if the hog-the-cpu free
running blitz these DOS programs create, you can run it just fine with the
AEA products.

In reality, THS is the only one of these OS/2 jewels I have ever been able
to get workgin wiht AEA well. DRSI cards have some other solutions,
including the German stuff you are talking about.

MARKET MANAGER - ANTENNA PRODUCTS

Larsen Electronics is an internationally recognized supplier of quality antenna products for two-way communications. We are seeking an experienced Market/Product Manager for Amateur and Commercial antennas.

Successful candidates will have in-depth experience in radio related products up to 800 MHz. Direct experience with LMR and Amateur markets is preferred. Bachelor92s degree in Business or Marketing, or extensive related business experience required. Position responsibilities include: Product line management, pricing, sales programs, new products, training, and technical support. This position will also include a competitive compensation, incentive, and benefits plan.

Interested candidates may respond by forwarding a resume92 including income history to:

Larsen Electronics, Inc.
ATT: Human Resources Manager
P.O. Box 1799
Vancouver, WA. 98668-1799
FAX: 1-360-944-7556

Pre-employment drug screen required. Larsen Electronics is an Equal Opportunity Employer.

[SNIP]

I'm not familiar with the magazine Ham Radio, but there is a web site
that might be it at http://www.hamradio.com
I've been looking into the 2Mbit data link article in the ARRL
Handbook and think that the easiest way to get the bits into
the computer would be ethernet. If the data rate was raised to
10Mbits, it could be connected to a LAN by attaching an ethernet
transceiver chip (not controller) that works on just an electrical
level (no packet decoding). The resultant full-duplex bit-stream
would then have to be sent to a full-duplex to half-duplex ethernet
converter.
The problem with raising the data rate is the wideband FSK
chip, a MC13055, cannot reliably handle a 10Mbit datarate, maybe
an MC13155 could be used instead. The MC13055 has an IF of 45MHz,
the MC13155 has an IF of 250Mhz. On the receiver board a mixer
takes the difference of the 105MHz first IF and the 150MHz VCO.
If the filter after ther mixer were changed, could it be made to
the sum, therefore generating a 250MHz signal? I don't know what
else may need to be changed to make this work, but databooks are
in the mail.

Well, I did a WhoIs search on Kantronics and came up with a domain
name of Kantronics.com. So I tried http://www.Kantronics.com/ but
it seems like the only thing they have up is a single page with
four (4) "mailto:"'s on it for tech support, sales, intl sales and
commercial applications.

It would be nice to see some technical info up there.

It turns out that even the MC13055 can do 10 Mbps OK. The speed restriction appears to be due to the performance of the data slicer, not the quadrature detector or fundamental bandwidth of the part.

The way I implemented it, I did not require rail-rail slew from the slicer and it could toggle at 5 MHz OK if only a couple of volts pk-pk was required. The speed limitation on the link, as originally shown, was due to limited bandwidth on the transmit side. Bias-push tuning is really not the way to get high information bandwidth. I did it as a demonstration of the utility of microwave and directional antennas for highspeed digital networks rather than as a recommended implementation. The receive side did recover data fine when driven with a microwave signal generator FSKed with 10 Mbps data.

My web page has some comments about higher speeds, different modulation techniques and more desirable architectures for such hardware.

PK-232.
>HF seems alright. But all the main packet frequencies on VHF seem to have an annoying buzz
(not 60Hz).
>Any ideas? Thanks - Tim

How early is your PK-232? Early units (pre-MBX) need more bypass
capacitors (connect directly between power and ground pins of each
IC) and better board grounding (single point to eliminate ground
loops). Also, all of them need to have paint sanded from mating
surfaces of the case and additional screws added, at least one
every 5 cm of seam, to make them RF tight.

I assume you've done all the usual things with shielded cables and
toroid chokes on all external wiring. You can quieten these things,
it just takes a good bit of bypassing, shielding, and suppression
to do it, in other words, just follow good VHF RF practices.

First try moving the power supply away from the monitor. The transformer
in there is a big electromagnet and can cause distortion of computer
screens.

>with packet radio in its' infancy on 2 meter. Could someone please update me
>on where packet radio is at today, expecially with regards to:
>
>1. Does packet radio use a graphical interface with the internet?

You could. Any of the popular web browsers can be employed. But see
below.

>2. What are the speeds of the modems?

The typical amateur is running 1200 baud *half duplex*, and if he
needs relay nodes, the effective baud is cut in half for each relay.
It can be desperately slow. However, it doesn't have to be that way.
9600 baud equipment is available (though radio modifications are
usually required to make it work), and 19.2 kb equipment is available
(though it generally requires a special radio), and 56 kb *RF* modems
are available (where the modem is the radio as well).

>3. Is packet able to keep up with the 28.8 modems or faster?

The 56kb equipment can, with average file transfer throughput numbers
in the 3k-4k characters per second range. The typical half duplex 1200
baud equipment used by most amateurs, however, has an effective throughput
of 10 char/sec *or less* (usually less).

>4. What would be the advantage(s) if any to accessing the internet with
>packet radio as opposed to PC's through phone lines?

You can do it where there are no phone lines, for example while mobile.
With the low speed equipment used by most amateurs, hooking to the
internet for anything but non-realtime Email transfer is absurd, and
even that is painfully slow. With the faster equipment, it becomes
practical, especially at 56kb, even web browsers can be used effectively.
And while 49 times faster, a 56kb station costs about the same as a
1200 baud station (if you include the cost of the voice radio).

>Packet Repeater? We are about to install one in Cary/Raleigh
>North Carolina and would like to talk to anyone with experience
>running one. What TNC node setting do you run? What settings
>in the users machines are appropriate, etc.....

Typically, there is no TNC in the repeater data path. It's setup
just like an ordinary voice repeater. Some folks have a bit
regenerator between receiver and transmitter, but there's little
advantage to that in practice. The additional delay the regenerator
adds costs about as much network throughput as the few fringe
signals it may clean up gains.

If a node is co-located with a digital repeater, it may be bridged
off the audio path (and its PTT diode ORed with repeater COR) rather
than being supplied with its own radio. Again, there is little
advantage to that over having the node located elsewhere in the
repeater's coverage. While the *repeater* is duplex, none of the
other stations in the net are, so the node behaves as if it were
just another user station.

The only necessary change in parameters for users is to lengthen
TxD slightly to allow for repeater keyup delay. The repeater is
just a bent pipe that removes hidden terminals from the network,
and makes every connection in the coverage the functional equivalent
of a *direct* connection, so there's no halving of effective throughput
by a digipeater. That offers a wonderful increase in total network
throughput, but there's nothing complex or magic going on in the
repeater.

"packet driver." Hmmm. Nope, sounds too much like DOS. What you
need is a VxD. A virtual device driver. I picture two types. The first is
an Inter-Process Communications driver (IPC) (or a PIPE). You could
then run JNOS in the background, and PIPE to the Win95 TCP/IP.
The second type would be an AX.25 device driver. In this case, the
VxD would interface the serial port (or PI card) to the network layer.

It won't happen soon.

Here's a good path to go (already mentioned a week ago). Use the serial
port in SLIP mode and run it to a junker 286 or 386. Then run JNOS on
that. You could also run PPP if you can figure out all the PPP switches in
JNOS. You could even run Ethernet with a "packet driver" on the junker.

Film at 11...

Salut Jean-Pierre

Why do you use Trumpet Winsock instead of the original Win 95 TCP/IP Stack ?

I have tried without any trouble to put a JNOS box on an ethernet LAN, using the NE2000 packet driver.
Everyone on the LAN could connect the JNOS box, would Win 3.11, 95 or NT (and their native winsocks) be used on the other sides.

But I cannot say anything about running Trumpet winsock on Win95. I'm using it on Win 3.11, making it communicate to a computer running JNOS trough the parallel port, but I never tried on Win95.
If you use ethernet cards, Trumpet wsk does not really seems useful ...

Michael,

We use a full duplex repeater here also. Although we use the bit regeneration
it is quite spunky(if 1200 is considered that!) hehe. As for software I would
strongly suggest you run TCPIP (jnos) which will allow much more control and
enhance the network with TCPIP. a very minimal PC (286) is all that is
required (along with tnc/radio) .
Good Luck on your setup.

>compile it (or make it) I get a linker error in a0.asm. Can any one help ??

You need to:

1. Edit the config.h
2. Edit the Makefile
3. Install your C compiler (BC 3.1 or greater) correctly (autoexec.bat, etc).
4. Type "make"

That's it.

522. Re: KISS TNC & Linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-27 00:00:00 UTC

>dont have a TNC and I don't really see the point in buying one only
>to switch off most of its functionality.

>My question therefore is: Would it be possible to use a Baycom style
>modem instead of an expensive TNC ? Or how about some kind of
>adaptor for an external phone modem ?

No.

The TNC is a serial port to radio adapter. A Baycomm is a bit port to radio adapter. The difference in the Baycomm, is that you have to send it all the bits as an HDLC chip would (SCC, SIO chip). The TNC in KISS mode will take the serial data, send it through the SIO chip, and then modulate the modem chip. The Linux system is a multitasking OS, and would not be able to operate quickly with a Baycomm which requires 2400 interrupts per second to transfer all the in and out bits.

What you are telling us, is that you want to put 5 inch tires on your new Cadillac (or Rolls Royce...).

Even if some schmuck makes a driver - Don't do it!

523. Has MSYS been ported to unix?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-27 00:00:00 UTC
From: delaney@j51.com
Message-ID: <4edoui$2iq@tzlink.j51.com>
Source record: 39053

Has anyone ported MSYS to Unix (specifically Linux)?
If not, has anyone had any luck getting it run under DOSEMU? Which is
what I'll try otherwise as soon as I get DOSEMU up.

>I used this method to measure the PTT to DCD delay on the 56k modems
>I've been designing. The number I got for them was 3 to 5 milliseconds.

This is certainly a fine approach to determining the required TXD for
a given pair of modems and radios, but the figure determined this way
will only apply to that particular combination. There's several sources
of delay:

1) The transmitting modem
2) The transmitter RF deck
3) The receiver RF deck
4) The receiving modem

For a conventional 1200/9600 baud system built using NBFM radios, I assert
that #2 and #3 are the dominant sources of delay. #3 can be essentially
eliminated as a source of delay by using a data-derived DCD rather than a
squelch derived DCD (i.e., the DCD state machine and open squelch operation).

I believe it is appropriate to figure out the required TXDelay for each
component in the chain, then tune accordingly, so measuring the TXD
of a particular radio independent of the end-to-end system requirement
makes sense.

I suspect your new 56k design eliminates #2 and #3 much the same way as
the first one did; is this correct?

>: Be wary of some of the so-called "9600 mods" floating around. Some were
>: written by people who just looked at the schematic, found the discriminator
>: output and varactor diode, and said "this will work" without ever trying it.

The Icom IC-228 is a very poor performer. Even after modifying the RX power (to not shut off during TX), it stunk. The basic problem is the range of linearity of the modulator. A redesign is necessary to take the linear modulation and translate that into a very small amplitude range.

Most other modern rigs are the same. 9600 sucks on most everything with these type of modulators.

The best radio on the market - price/performance - is the TEKK KS-900. Its only shortcoming is the 1.5 to 2.0 Watt output. But a brick fills in the power real well.

Paccomm sells these with the correct wide filter.

541. KANTRONICS KPC9612: Help wanted:-

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-28 00:00:00 UTC
From: vk7kob.canberra.dialix.oz.au
Message-ID: <310a109d.1459220@canberra.dialix.oz.au>
Source record: 39071

Hi! I'm the proud owner of a new Kantronics KPC9612 dual speed (1200/9600 baud) TNC. I have been playing, successfully, with both vanilla AX25 and TCP/IP protocols for some years with JNOS, TPK, Paket 6, FBB ver.1.15c and others some in, and some out of KISS mode where and when appropriate to the software. I have no problems with packet radio and the hardware here has not changed at all except for the acquisition of the above TNC.

My problem is this: I have been using JNOS110L (and M) with both this TNC and another both of which went into KISS mode, no problems. For some reason, the KPC9612 does not activate the PTT line in JNOS yet it IS in KISS Mode as required. I have given it the proper instructions to get it into KISS mode:- INT KISS
RESET
and it seems to go happily off and do that. JNOS does not appear to know the TNC is there, it doesn't, as I said above, key the PTT lines nor copy anything from the radio yet I know that the wiring IS correct. In any case, I believe that the Xmit LED should come on when the PTT line is being keyed with or without the radio connected but nuthin' happens on that TNC. What makes it even more of a mystery, is that without changing anything else, I can use another TNC in KISS mode, configured on the same port, to work perfectly in JNOS and in KISS mode. Even more interesting is the fact that the KPC works just fine on normal AX25 software out of KISS mode on the same Comm port.

Am I missing something rather obvious or am I missing something rather more esoteric to KAM owners.....??? I've read the TNC book/manual, now I'm waiting for the movie.....

Thanks, Kam Owners, LOVE to hear from you.....

73's de Bob.

From: bryan@ampex.com
Message-ID: <DLvDnt.JD8@ampex.com>
Source record: 39072

Surely someone has run across a good packet program written for Windows 3.1 or 3.1.1. I'd sure like to find it. If you know of an ftp site with such a beast, I'd like to hear from you.

Please don't bother sending info on WINPACK (a program out of Europe). I looked at it and must say, it fits the mode of most European software I've had the opportunity to try...feeble at best. The author of this piece admits he hated evry minute writing it, and it shows.

Thanks in advance for your reply........

You may also need to have TASM installed. TASM, Turbo Assembler was included with BC-3.1 however it is a purchase option with BC-4.0 and up. TASM 5.0 is just about to be released. Also there is a closeout house in Seattle, WA that still has complete sets of BC-3.1 for a reasonable price.

Well its happened.We the club members of the 82 repeater in Kansas City are dam mad.We didnt get
to vote and we didnt get to talk before the board decided to shut down the repeater between the hours
of 11 pm and 5:30 am.
There is over 600 members and these member are told that they can use the repeater because of one
person that misuses the repeater.This person has made it a living hell for all of us.So the club does this
and thinks that members will just say ok.On top of that the FCC is no help at all.They dont give a dam if
ham radio looks and sound like the cb band.And the old timers just say"Nocodes are the problem"
Well I give up.I dont know what to do anymore.I wonder why I got my ticket.And as I see it the hole
hobby is going down the drain.Im going to just call the ham band the chicken band radio.
And to Rick and all of the people that act like Rick.I hope that you are happy with what you did to the
82 repeat in Kansas City.
To the FCC I think that they should fire the lot and close the door.They are worthless.

Please do not reply back because I just dont give a care anymore.....

For the rest of you out there that love ham radio,I wish you good luck.

On the 146.85 repeater here in Central NY we had trouble with one user also. He made it that
no one would even monitor the reapeater anymore. The club voted to ban him and we did. The reapeater is a great place to be again.

That's a weird story. The jerk behaves badly enough to be banned but is
obedient enough to obey your request that he voluntarily not transmit on
the legally licensed (input) frequency. Were there some strong words of
`encouragement' that went with the banning?

I have been running Graphic Packet for OS/2 for a WA8DED TNC for about
3 months. The doc files are in Gernam but you can dope it out.
I haven't tried to run a KISS TNC with it as the drivers to interface
the hostmode terminal program to a kiss tnc seems to be DOS....

Not necessarily. Receiver *recovery* time is often significant. This
is the time between the cessation of transmission and the return of
receiver response to normal. In some transceivers, this is the *dominant*
delay. And RF carrier sense *can* be faster than DCD state machine lockup.
It often isn't, but it can be. The main advantage of DCD state machines
is a reduction in falsing, not improved speed.

I'm just surfing here but I do own a Sony shortwave and am looking for the
FAQ btw, I'm looking to see if a Sony IFC 2010 is worth getting repaired;
the switch doesn't work on the side of the radio where it turns on and
off, not the switch near the top of the digital dial readout portion.

But anyway, my wife is an occupational therapist and suggests the following:

Trace ResourceBook, 1996-97 edition
Waisman Center
University of Madison, Wisconsin

It offers assistive technologies for communication, control and computer
access. The terminlogy to use that you want information for is "sip and
puff" material.

Also try NARIC

Thank-you for reading this. My name is Michael Long (KB8WPE) and I am the Public Relations Manager for the Husky Amateur Radio Club (HARC) whose callsign is W8YY. The club is located on the Michigan Technological University campus.

Starting on February 1, 6am EST, and continuing on until February 3, 6am EST, W8YY will be running a Special Events station for Michigan Tech's Winter Carnival '96. The frequencies listed below are the most likely place we will be operating. For this Special Events station we have 8"x11" certificates that would look great on anyones' wall! All you have to do is contact us and then send a QSL with a self addressed stamped envelope to receive the certificate.

Here are the frequencies:

Band Frequency Mode Time
160m 1.90 MHz LSB 8pm-8am
75m 3.90 MHz LSB 10pm-8am
40m 7.25 MHz LSB 7pm-10pm
20m 14.250 MHz USB majority of the day (8am-7pm)
17m 18.150 MHz USB if open 8am-7pm
15m 21.350 MHz USB if open 8am-7pm
10m 28.40 MHz USB if open 8am-7pm
2m 144.2 MHz USB All the time
146.58 MHz FM All the time
70cm 432.100 MHz USB All the time

Again, thank-you for reading this message and all of us here hope to here from you during the Special Events station!

For any more info. email me at cmlong@mtu.edu or the Club President, Dave Gillahan, at dmgillah@mtu.edu

You can also check out our homepage at
http://techsrv1.tech.mtu.edu:8080/harc.html
Though it is just beginning it does have a little information on it.

Sincerely,
Mike Long -KB8WPE-

I'm an avid Internet freak (Also a Linux addict) using a 14.4 baud link on my /only/ phone line. Now this isn't my only phone line to due to $ restraints, just because my father will not get another phone line. I constantly get yelled at for being on the net (tieing up the phone line) and are looking for alternatives. I was told about Packet Radio from a friend, who knew little accept the fact that it exists. I don't have a HAM amatuer license, but if need be, I can study and attain one. But i'm looking for internet access alternatives and will do almost ANYTHING to get on the net via Packet Radio. I just need to aska few questions:

1) What hardware do I need
2) What are the highest speeds
3) What is the cost
4) What is the availability

I live in southwest Florida, in a county of 100,000 people. I just want to get internet access without tieing up the phone line. Can someone please point me to a FAQ or URL with information torwards my goal.

Thanks and if possible could you reply via e-mail because I'm no good at weeding through usenet ;)

It is true that the use of DCD (in comparision to RF level or audio
level detection) does decrease falsing, but, as I recall, probably
the largest advantage of DCD in 1200 baud AFSK is the elimination
of delay in the receiver squelch circuitry.

Granted, receiver recovery time is also often significant; I had to
modify my Drake TR-22 to not mute the receiver during transmit since
there was an enormous RC time constant in that circuit. However, receiver
recovery time shouldn't be part of the TX Delay equation; receivers
with poor recovery times simply should either be modified to have a
short delay or not used ;-).

I haven't tried it yet, however I think I remeber that the earlier version of it cannot use other than COM1 or COM2 and then only with the standard IRQ choices of IRQ 4 and IRQ 3.

Many of these packet programs for DOS run just great, if.....

They are the ONLY comm program running! (Just 1!)

What I found out is, that the instant you start playing with more than one communications program at the same time, a glaring error in the way most DOS type communications programs surfaces. Most of these TNC programs are what we call polling programs. They constantly hammer the CPU with interrupt requests for service. This is NOT a happy situation in the land of pre-emptive multi-tasking. All of a sudden, what was a neat TNC program that did just fine by itself, now blows away the CPU and has ALL sorts of troubles when run with other I/O intensive tasks.

I could not find a single DOS VDM based TNC program that I could use with the AEA line, my MFJ-1278, or my DRSI card that did not produce everything from SYS 3170 errors to keyboard thread loss, to PID loss, to, you name the problem. Some of the TRAP D errors and so on can really bite you. They wind up scrambling your hard disk BIG TIME. I think I would up re-installing OS/2 at least twenty times during all this nightmare, even proofing a couple of test kernels for the crew in Boca Raton before we all gave up.

I run my own station control program, including the use of the MFJ-1278 unit as a CW generator and copy machine on my HF setup in COM1 as a DOS VDM session. At the same time I maintain FidoNet 1:117/3000 at V34 rates for

simultaneous voice/fax and data on one phone line using the ZFAX/ZYXEL modem series on COM3. I hold COM2 for a second ZYXEL for merged line service with the BBS and/or simultaneous IP provider service to the Net. COM4 feeds the AEA PK900 I use for both 1200 baud cluster service and a simultaneous gateway to 9600 baud.

I can substitute another PK900 for my own HF station control instead of the MFJ-1278. At some time, that will give me dual TNC use and the cluster monitor embedded in my own station control screen, instead of taking it in on a separate port, freeing that port for simultaneous VHF/HF gateway operations instead.

For a number of reasons, I still use the VERY old OPUS 1.73 BBS software, front-ended by ZFAX3/4 for inbound voice and fax service. Much of my other interests are linked to what OPUS does. Were ZFAX available in a completed OS/2 version, instead of DOS, I would change in an instant to MAX for OS/2; I could modify my other needs to work with MAX.

I use the THS-OS/2 version to handle the PK900. Other than no buffer recall of the PK900 when the program is down, this works fine for me.

I can run the NCDX echo on 3516 Sunday nights on CW at the same time the BBS is handling a solid V34 file transfer for the entire time of the bulletin, at the same time the VHF TNC stuff is running in another session window, and at the same time I am simultaneously watching the OH2BU WW cluster on the Net, as well as the local cluster, together with GEOCLOCK running in another session behind these and Bach playing on my CD-ROM through the Soundblaster. 0245GMT on 3516 gets busy at time 'round 'heah. 'suh.

:)

Tried all that with Paket 5.x for DOS; it blew up.

Slated for further work is another pair of BPQ switched PBBS VHF ports that will run when the I/Net COM2 is idle. BPQ exists for OS/2. I intend to make available the entire 117/3000 land line BBS on 9600 baud or better just for show and tell, the Lord willing and the creek don't rise.

The one thing I cannot do yet simultaneously with any of this comm stuff, is to use SYPLUS for a full tape backup a the same time the comm deals are running. SYPLUS, although a very good program just demands more of the CPU's time and disk I/O, than the comm stuff can tolerate. It also seems to have not so good compression capability on my 2.4G CMS 1/4 inch tape unit I bought.

I feel it is a shame that IBM did not give us more than one asyncronous comm channel through WARP 3.0 CONNECT. I have heard that problem may finally get fixed in version 4.0 of WARP which, is apparently code named MERLIN and is due ship about a couple of months from now.

I think I push a box pretty hard, P90 with 16MB of RAM, however, my friend with LINUX, Paul Sittler, KC5DNE, services some 16 phone lines at leviathan.tamu.edu with only a simple 486-DX66/2 for the server there at

a current hit rate of about 250,000 per month.

He says a 486 is a terrible thing to wais.

I suspect Paket 6.1 would terrorize that deal as well.

564. Interest in ARES/RACES newsgroup?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-29 00:00:00 UTC
From: William Vaughn <billv@olympus.net>
Message-ID: <4ehqbt$o03@olympus.net>
Source record: 38945

I am curious if there is any interest out there in a sperate newsgroup aimed at ARES RACES operations. Something like rec.radio.amateur.emcomm or something like that. Please email me with your response, if there is enough interest I will take the initiative and jump through the hoops to get it going.

565. FS: TI C5x DSP Starter Kits (DSKs)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-29 00:00:00 UTC
From: cole@netcom.com
Message-ID: <coleDLxDon.JIG@netcom.com>
Source record: 38946
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I have several TI 320C5x DSKs (DSP Starter Kits) for sale. The TI part number is TMDS3200051. They are all brand new and have never been opened.

These kits are designed for students, experimenters, and developers who need a simple, low-cost way to prototype DSP-based applications for the TI 320C5x series of DSP chips. The kit includes a small (2.5" x 4") PC board with a TMS320C50 processor, a TI Analog Interface Circuit (AIC) chip with 14-bit A/D and D/A capable of sample rates to 19.2 K samples/sec, RCA jacks for analog I/O, and a 9-pin RS-232 host interface. The kit also includes a simple assembler, loader and debugger for the PC, a kit manual and a TMS320C5x manual.

The latest versions of the software as well as several user-written demo programs can be downloaded from the TI BBS, accessible via TI's FTP host ftp.ti.com, in directory /mirrors/tms320bbs. The board requires a 9 volt *AC* power supply capable of >250 ma. A 9 VAC 780 ma supply with the right plug is available for $8.99 from Radio Shack (Part # 273-1630).

TI sells these through distributors for $99, and purchasing them through distributors can be a hassle. I'll sell them for $60 each shipped within the US. Terms: Price is firm. The units are guaranteed against DOA. Immediate shipment if payment is by USPS or other money order or cashier's check. Personal checks are OK but I'll wait for them to clear. No CODs, please.

Yes,

You have to jumper the tnc audio output to high then use the
adjusting pot to get the proper deviation. If you don't have
a deviation meter just get a second radio and listen to your
signal compared to another to a known strong station in your
area. The good news is when you have the packet hooked up via
the port you can use the 5100 on voice also.
Hope this helps.

569. Can J/TNOS for Linux run without a terminal?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-29 00:00:00 UTC
From: chris@kd3bj.ampr.org
Message-ID: <chris.822919890@kd3bj.ampr.org>
Source record: 38950

Is there a Unix version of J/TNOS (or some easy hack) that allows this program to be started at boot time and run in the background? I hate having to start it and waste a terminal (even a virtural one!).

= = =

Key points:

Remember, I'm running Linux, not DOS.
No, I don't want to install kernel AX25.
No, I don't want to manually run JNOS under expect.

>I am curious if there is any interest out there in a sperate newsgroup
>aimed at ARES RACES operations. Something like rec.radio.amateur.emcomm
>or something like that. Please email me with your response, if there is
>enough interest I will take the initiative and jump through the hoops to
>get it going.

One of the best ways to determine if there is enough interest for
a new group on some topic is to look at the number of articles posted
about that subject in the general interest newsgroup from which it would
be spun off, in this case rec.radio.amateur.misc. If you've seen 100
posts on your topic in the past month or so, that's a good indication
that there is enough interest to get a formal newsgroup created. That's
because it takes 100 more yes votes than no votes to create a new group.

If you've seen very little posted about your special interest, it is
unlikely the new group would be successful, and unlikely it would
receive enough favorable votes to be created. When the rec.ham-radio
hierarchy was last reorganized into the set of groups we have today,
a rec.radio.emcomm was one of the proposed groups. It failed to gain
enough support to be created.

I'm a pretty liberal site administrator with plenty of spare disk
capacity, so I'd probably vote yes for a new group, but a lot of
other news administrators are tight on space or communications
capacity, so they might be inclined to vote no unless you could
make a very convincing case for the group.

One method to do that is to create an alt group. If the volume in
the alt group is sufficient, it would be a strong argument to
move it into the regular hierarchy.

Gary

579. Kantronic 9612 and Kenwood TH-79A

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-29 00:00:00 UTC
From: hornej@rastro.Colorado.EDU
Message-ID: <4ejf0u$2e8@peabody.colorado.edu>
Source record: 38960

Has anyone had success using Kantronics' Packet Communicator 9612 in conjunction with a Kenwood TH-79A HT?

I have wired the radio to the 1200 baud port according to the schematic in the Kantronics manual for the Kenwood TR-2600.

When I listen to the audio (as in Calibrate mode) that is transmitted, it is much softer than the typical packet signals. I have adjusted the level internally to the max output, but still not loud enough.

Any suggestions?
Thanks in advance,
Jonathan

580. Lear Siegler ADM-5 to KPC-3

>Not necessarily. Receiver *recovery* time is often significant. This
>is the time between the cessation of transmission and the return of
>receiver response to normal. In some transceivers, this is the *dominant*
>delay.

True. I have added some extra txdelay to be used only in those cases
where the transmitter is keyed up immediately after carrier on the
channel drops, e.g. when replying to a transmission on a point-to-point
link. Thus, the txdelay is longer in this case than it is when
transmitting on channel that was clear for some time.

This was required to run with a very short txdelay using commercial
trxes with slow T/R switching times.
(well, actually you would need the extra txdelay only when the first
packet in a transmission is destined to the station that last
transmitted on the channel... maybe something to keep put the list)

>And RF carrier sense *can* be faster than DCD state machine lockup.
>It often isn't, but it can be. The main advantage of DCD state machines
>is a reduction in falsing, not improved speed.

An important disadvantage is that a marginal signal or a collision
is not recognized as a valid signal, generates no DCD, and is thus
transmitted over.
When two stations collide, all the others jump on top of that :-(

Also, when multiple speeds are used at a single station (as a method
of gradually increasing speed while maintaining backward compatability
for some time), state machine DCD causes unnecessary collisions.

hmm, although I haven't tried it, you should be able to run TNOS in the
background by starting it with the &. such as
tnos &

Granted, you wouldn't be able to see any of the output, but it doesn't
sound like you want that anyway. Just out of curiosity, why not use a VC,
you can have up to 63 of them? Or why not an rxvt?

Hello. all Winpack Users..

I am running a newsgroup server (like Carbon Copy) that I wrote for winpack. I am currently running a winpack group which has over 30 members..

A couple of chaps have been writing some scripts, playing with the PGP server and some interesting addons.... It's not going to set the world on fire but it's good value.....

If you would like to join, either e-mail me or send me a packet message telling me you would like to join. I do not want to pass stuff out on the internet as I prefer to use packet...

Cheers..Peter

Cheers..Peter

Why would you want the state machine DCD when you already have a
good RF-sensed carrier indication?

>>Also, when multiple speeds are used at a single station (as a method
>>of gradually increasing speed while maintaining backward compatability
>>for some time), state machine DCD causes unnecessary collisions.

>connected together in a logical-OR configuration. An RF-sensed
>carrier detect may be good enough here, but the beauty of multiple
>DCDs is that you could look at the DCD LEDs to see what is happening
>on the channel ;-).

The point in having multiple modes is to allow the use of older, slower,
equipment (at least temporarily) until everyone has moved to the
highest supported speed.
It is not very sensible to require everyone to have multiple DCD's
installed. When everyone had to modify his equipment, you could just
as well only implement the highest speed and let everyone use just that.

(several node and BBS systems support mixed-mode accesses supporting
two or three out of 1200 bps AFSK, 4800 bps HAPN and 9600 bps FSK. it
works nicely as long as not too many active users use devices like the TAPR
state-machine DCD, "software carrier detect" features in programs like
Baycom, etc)

signal processing boards for the PC?

1) Is there a reference resource to get info on PC audio signal processing boards & software?

2) I have the SB-32 in a 486/66 with plenty of memory. But I've had no luck finding software for the SB-32 that will do any real-time DSPing. Can the SB-32 board be used as a real-time DSP to take the audio line-out on my Grundig to clean up the audio a bit? Or if I want to use the PC, do I have to acquire a full-fledged DSP board?

591. FS: KPC-2 TNC and 145.01 Base

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-30 00:00:00 UTC
From: "Robert J. Hall" <rjhall@mtu.edu>
Message-ID: <Pine.SUN.3.91.960130030917.18389D-100000@techsrv1.tech.mtu.edu>
Source record: 38896
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap,rec.radio.amateur.digital.misc

Hello .. I have decided to sell my KPC-2 Packet radio TNC and
Regency BTH-201B 25 Watt VHF Tranceiver crystalled to 145.01 MHZ.

I am asking $70 for the KPC-2 ALONE.
The KPC-2 With the REGENCY BTH-201B radio I am asking $135
I will also be asking $5 for Shipping.

The Regency base station is all ready to go and is Currently wired and
working well with the KPC-2. The base station has it's own built in
Power supply. Size is approx. (15" x 9" x 3.5") Regency BTH-201B 25 Watt
VHF Tranceiver crystalled to 145.01 MHZ. Receiver sensitivity and
selectivity has been recently checked on a 2400 Motorola Service Monitor
and checked up to factory specs. Output power bench checked at 30 watts.

I am not interested in selling the radio seperate from the TNC, but would
be interested in selling the TNC alone. If I don't sell them I'll
continue to use them, and If I don't sell the radio with it, I'll crystal
it for voice and use it there.

The KPC-2 has version 2.85 firmware and has PBBS, NODE, and DIGI
functions. It's run well for the last 4 years without ever having a
problem. It originally cost $170. I orginally purchased the Regency
about 2 years ago from a friend for $60 and recrystaled and tuned it for
another $30 from Jan Crystals. It works well and also has never given me
any problems.

I don't normally have time to monitor the news groups so any response to
this should be via e-mail or phone listed below.

Most of the low orbit sats are 9600 baud. You will want the PK-96 for these birds. You might want to consider AEA's new TNC as well. It is the DSP-232. It does all modes.

There is a program called MORSEFFT which you should be able to find on the net
(use ARCHIE to find the site storing it)

It needs a sound blaster card as an input device. It comes with C source code,
too

The common TAPR state machine DCD kit does allow the connection of an
RF-sensed carrier sense indication to be connected. *If* you've got
a receiver that generates such a signal decently, this can prevent
the false DCD problem mentioned above....

>Also, when multiple speeds are used at a single station (as a method
>of gradually increasing speed while maintaining backward compatability
>for some time), state machine DCD causes unnecessary collisions.

.. and here, too. However, if you're running multiple speeds on the
same channel, you ideally would have a DCD appropriate for each mode
connected together in a logical-OR configuration. An RF-sensed
carrier detect may be good enough here, but the beauty of multiple
DCDs is that you could look at the DCD LEDs to see what is happening
on the channel ;-).

Technical solutions do exist. Using a "TX-ID" board, which uniquely
fingerprints each transmitter and a PC one can "slectively" include or
preclude individual users.

The board was not meant for that purpose, but with just a little Basic of C
codes, it workd just fine. It is especially easy if you have a single or
limited number of receive site.

Good luck and Have fun.

From: Jon Bloom <jbloom@arrl.org>
Message-ID: <310E56DF.3AC3@arrl.org>
Source record: 38975
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

I'm looking for information from anyone who has developed a technique for transferring CCITT group-3 fax (i.e., standard office fax machine data) via radio. The "ideal" system would be one wherein a person at point A stuffs a document into a fax machine and it comes rolling out of a fax machine at point B, with the connection between the points being a radio link. But I'm interested in *any* techniques being used to achieve fax-via-radio. (Note: NOT WEFAX, APT or what-have-you. Just G3 fax!)

Thanks.

I'm trying to use my AEAfax to receive FAX/RTTY. But My computer
generates too much interfercne. I know its not the
monitor,mouse,keyboard,&modem. I've removed all and powered up CPU and
still get noise. I've taken CPU to another room (on another electrical
circuit) and still get a +20dB noise level from CPU. Now I'm on the
second story of a townhouse and my radios are only grounded to the
electrical system ground. I'm thinking of running a ground wire from
second floor wind and driving a rod in the ground. Will this help? I
know nothing about grounding.
Tnx
George

609. real remote via ethercard ?

Newsgroup: rec.radio.amateur.digital.misc

hello es tnx reading my questions,

1. some days ago I have put together an extra pc (running by DOS and WinWGs) for ham related things. The other PC (for normal work ;-) has a ethernetcard too and the net.drivers (netware and MsNet) are working well. But I can not do a really remote. Means I would like to have control by keyboard and monitor on the local pc but the programm itself is running on the other one. I found some stuff for working by serial line but nothing for ethercards. (?)

2. the ham-pc should run WNOS. But I have some trouble to startup an tnc running the wa8ded firmware. Knows someone where I can find the FAQs.

3. (sorry not a ham related one) I have to put a fone-line-modem to a workstation running by AIX 3.2. I know some some stuff for Solaris-unix but nothing for the IBM-unix. If someone has a hint I would be plaesed. To know where is to find a FAQ would be helpful too.

tnx for patient reading my questions agn es vy 73 de Wolfgang (DL7VWH) from Berlin

No, George, running a wire to Earth will merely provide another
conductor from which noise can radiate. The case is "hot" with
RF now, and that wire would be "hot" with RF too, in effect an
antenna. The fact that it is connected to Earth at the far end
won't stop it from radiating. You must improve the shielding
of the computer. Treat it just the way you would a VHF transmitter
(because that's what it is) and use good VHF shielding practice, IE
metal to metal seam bonds, a screw at least every 5 cm along a seam,
no openings larger than 1/16th inch anywhere in the shield integrity
(use wire mesh over any ventilation openings), etc. You should be able
to achieve shielding attenuation of at least 60 db using standard
techniques. Of course all external wiring must also be shielded, and
bypassed effectively.

Gary

Go to the Arizona Repeater Association's Home Page to see how this is done. It involves actively pursuing people who engage in such activity. The ARA, as a matter of routine, has an interference committee dedicated to tracking these people down.

Despite reports to the contrary, the FCC does frown on this activity, and will enforce sanctions. Just ask the people here in Phoenix about that. An NAL, Notice of Apparant Liability, carries a stiff monetary fine, about $20,000 (US) worth and forfeiture of ALL broadcasting equipment and license(s).

It has been reported to me, by Dan Ford, Commander of the SHERRIF'S Ham Radio Posse, that they also plan to actively engage in pursuing people misusing radio gear in Maricopa County. I strongly suggest that if you plan on jamming a repeater in Central Arizona, plan on getting caught.

Unfortunately, the ARA has had, for the 3rd time its existence, had to remove a member, by board action, for misconduct involving repeaters. This "gentleman" is also facing stiff legal sanctions from the FCC.

In 1995, the 3 biggest abusers of ARA repeaters WERE caught, and several others have been identified.

I am a no code TECH so I operate only above 50mhz for now.

I have a Yaesu Ft-736R with 6m, 2m and 440 capability.
I also have a Ft-840 w full coverage from AM band thru 30mhz for SWL.

Should I get a packet only TNC to use with the 736 and get a
separate FULL digital unit to listen with on the HF unit ???

Or can I get one super TNC and cable it in a way so both radios
can use it?

> My web page has some comments about higher speeds, different modulation
>techniques and more desirable architectures for such hardware.

As my answer to the interface problem I designed a little circuit to replace
the 20 pin hydrid on the ARCNET boards found in this part of the world. I
hoped 2.5 Mbps NRZI would be within the capabilities of the link. I've
never found time to test it. If someone would like to try this approach I
could see if I could get the schematic into some sort of net compatible
form.

Gerry,

Have you been able to use the KPC-9612 to copy TCP / IP stations and connect to them in ax25 ? Was playing with one at work, could get a reported connection just fine on port 2, but never got past that. In the AEA products if you turn on Mproto, then the TCP / IP stations come alive. I also need to know how to configure jnos attach kiss statement so it will pick up the second port.

>
>Any suggestions?
>
Well my pet concept is meteor scatter. This is not a new concept to
the DoD, but as far as packet radio goes with the cheap TNCs, I think this is
one possible way to send data significant distances w/o the slow speed of HF.
There are other tradeoffs as well. The idea is to replace the firmware to
make a low cost meteor scatter station. With regards to antennas, power and
radios this may not be so simple. I was thinking that the controller might
"peck" the path waiting for an opening, and then would send as much as
possible in the second or two the path works. Or alternativly, it would
repeatedly send data with pauses waiting for the ack. Some things I have
heard about comercial systems, an opening can be expected on average once
every 15 minutes. High speed to cram as much data into the opening as
possible would also be worth examining.

Regards, Bill

I'm glad you support the author in his effort to produce a product
free of cost for people like you to use. I think you are extremely
impolite in your response. I keep in regular contact with Roger
Barker and he is EXTREMELY helpfull and supportive of amateurs that
use his product... I have written addons for winpack and it has just
about the BEST mail engine in a packet program. It is VERY easy to
interface to Winpack using external code. All other windows type
packet programs dont have any hooks for you to get into. They are so
glossy but once you get past the surface, they are SO limited !!

Read the source code of reqfil. You can tell Roger knows what he is
doing. It is very well written and efficient !!...

If you want a program to do everything for you, go to Ultrapak or TPK.
If you want to give winpack such a big serve, go and write one
yourself !!!!!

Cheers..
Cheers..Peter

And what's usually happening on the channel is congestive collapse.
It's a *very bad* idea to run mixed speeds on the same channel.
Some idiot will be running a 1200 baud only TNC, and it won't
sense the other speeds, and there goes the channel.

Gary

636. RE: OS/2 Terminal Programs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-31 00:00:00 UTC
From: J_Towle@msn.com
Message-ID: <00001fec+000011c6@msn.com>
Source record: 38916

Eric,

OS/2 (and Windows) are both excellent multitaskers. Programs written with multitasking in mind often run as well, if not better, than so-called "native" applications, in part because they are typically in native machine code (vis a vis such things as Visual Basic apps which are a form of p-code, interpreted, and hence slow).

The benefits of the environment, dynamic linking, object embedding, etc., are great, but for some things like operating a TNC, in single or dual port mode, and in modes like AMTOR, PACTOR, GTOR, etc., the linking and embedding are less important.

PkGOLD and KaGOLD have features that are suited to communications, and are also multitasking "aware" -- that is, they give back time to the OS.

If you haven't seen current versions of PkGOLD or KaGOLD running in either OS/2 or Windows 95, you might be surprised to discover that they operate well in a DOS box/window, multitask smoothly, and do lots of important communications things. And the manual, accessory printed material, and full on-line help are all in English.

Pass along your name and address and I'll send you some information. Or visit our Web Page:

I have a townhouse and my radio equipment on the second floor. I'm thinking of running a ground wire down the outside of the house (going through the window right next to my radios) and driving a rod into the ground. Question 1) will this help get rid of noise on my ICOM R71A caused by my computer? 2) what gauge wire should I use? & 3) what length of ground rod should I use to see some results?
Thanx from a very RF Noisy Shack (maybe someday I'll see the WX Fax!)
George.

638. HELP! Wireless networking!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-31 00:00:00 UTC
From: srl968s@nic.smsu.edu
Message-ID: <4eohhr$c3r@ursa.smsu.edu>
Source record: 38918

Hi! I know nothing about amateur radio but I recently read about "packet radio". All I really know about it is it's typically only about 1200 baud and functions kind of like a modem but instead of using the phone lines it uses airwaves. I am VERY interested in this because I have two computers, one at my girlfriend's apartment about 3.6 miles away and I want to network them together. ISDN is WAY too expensive, and dedicated phone line costs rack up. Wireless networking sounds like a really cool thing to do... can I do it with packet radio? I am needing something that is full-duplex (asynchronous)... or at least looks like full-duplex to the computer, and it needs to support some kind of networking scheme, like TCP/IP (which I've read packet radio can do). Most importantly, I need a MINIMUM speed of 14.4k to be tolerable, preferably faster if possible. Is this possible? If so, what are the costs of all the equipment and other stuff? What are the drawbacks? Benefits (besides being wireless)? Please let me know! I am very excited about the possiblity of a wireless connection.

>advances that can but used ots in large organizations like DoD.
>
>Any suggestions?

The main things hams have done is take ideas developed originally
by the military (DARPA, etc) and make them *cheap*. Examples are the
56 kb RF modem (now off the shelf from PacComm), and DSP HF stuff
like Clover (off the shelf from HAL). There's Mil Std stuff that's
at least as good, but costs megabucks more.

A couple of hot *applications* are APRS and PacketCluster. Both
might find military application, but neither is secure, and there
are better ways available to accomplish similar objectives.

Perhaps one thing of interest would be the Pacsat protocol for
delivering traffic to and from little LEOs. It's efficient, and
could easily be made secure.

>with a PK12 or some other basic TNC? I don't know anyone using
>9600 baud. Is it worth it?

If you want to do satellite work, Don, you have to have a satellite modem. The satellites use either 1200 baud PSK or 9600 baud FSK depending on the satellite. So that means you want a TNC that will accept external modems on a TAPR disconnect header. Your choices would be PacComm or MFJ since they make 100% compatiable TAPR TNC2 clones. Adapting a satellite modem to an AEA or Kantronics TNC would be much harder. (Though, you could use AEA's DSP TNC. That will emulate a satellite modem. Or Kantronics has the Data Engine which has TAPR style modem headers, but both of those choices are pretty expensive. TAPR also has a kit that lets you modify the AEA PK-232 to accept an external modem. The simplest and lowest cost method is to use a real TNC2 clone.)

The problem is with the PSK modem, all the manufacturers make 9600 baud modems you can use, but the regular terrestrial 1200 baud modem won't do for satellites (except for MIR). Satellites use PSK modems (for improved weak signal performance) rather than AFSK.

So you want a MFJ1270B or a PacComm Tiny 2. Then you can add a 1200 baud PSK modem (available as a kit from TAPR) and a G3RUH style 9600 baud FSK modem (available from several sources), either of which can plug into the TAPR disconnect header on the TNCs. With the default 1200 baud AFSK modem built into the TNC, that covers all the bases except telemetry reception from Oscar 13. That requires a 400 baud PSK modem, kits for that are available from Radio Kit.

The basic TNC and all the modems will total around $350, which is still quite a bit cheaper than a DSP TNC from AEA (last I looked the DSP-2232 was $995), though their new DSP unit is quite a bit cheaper than their old one. I'm not sure that they have debugged satellite modem firmware for it yet, however. They do for their more expense older DSP unit. If you had a PC, you could also use TAPR's DSP board. And if you're a good coder, you can use any of the cheap DSP evaluation boards, the Analog Devices EZKit is attractive at $89. You could program all four different modems you need on it and run SoftTNC on the MAC instead of going with a hardware TNC. (The MAC already has the 8530 synchronous SIO chip built in, so it

can do the TNC function inboard without incurring the penalty something like Baycom poses for the PC where the synchronous conversion has to be done by bit banging in software.)

642. Re: RTTY MODES

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-31 00:00:00 UTC
From: Hans Devreij <eu000395@pophost.eunet.be>
Message-ID: <4eors7$rge@news.Belgium.EU.net>
Source record: 38922

With dozens of systems around, the trial and error method may cost you a lot of time.
There are hardware decoders (i.e. Universal, Wavecom) which automatically determine the system you're tuned to. More sophisticated RTTY software (i.e. Code3, Code 30) does the same. But both types of decoders come at a price - count anywhere between $500 and $1,000 depending on the options installed.
The cheapest automatic detection device I've come across is the Momentum MCL1100, but in only decodes standard Baudot, ARQ and FEC (and morse, of course). But as far as price is concerned, it still is much more expensive than a second-hand Code3 set, which decodes some 40 different systems, including fax, multi-channel TDM and 4 different PACTOR variants.

: Or can I get one super TNC and cable it in a way so both radios
: can use it?

: KE4IKT

My recommendation is to get a good multimode, like the PK-900 or the KAM
and hook it to both radios. If you don't want to spend that much money
a used PK-232MBX will allow you to connect to both radios also, but
you can't use them at the same time. There is a switch on the front
panel that lets you switch between them. Frankly, I find little use
for the dual, simultaneous port access of my PK-900, but then I don't
use the dx cluster and chase dx either. When I want to connect to
a packet station, I do so and when I want to carry on a conversation
on a digital mode on HF, I do that, but I can't remember ever wanting
to carry on two conversations. I get confused enough with one. 8^)

It looks like you are in Atlanta. Feel free to call me sometime
if you want to talk about digital modes...

73,
Jim.

: Was the speed limitation caused by problems in the driver circuit or by
: something inherent in the gunplexer? I mean, if you looked at the supply pin
: on the gunplexer would you see a good 5 MHz square wave?

The problem with the motion detector/radar gun Gunn sources is in trying
to get low distortion frequency modulation at large deviations/rates
using bias-push tuning. This is *not* the way to generate a high quality FM
signal.
The dynamic resistance of these devices is actually quite high (they
are negative resistance devices after all) and even the lowly 3-term
regulators manage to deliver an acceptable waveform to the oscillators.
However, if you plot the voltage-> frequency and voltage->amplitude
responses for typical oscillators (as I did in the referenced Ham Radio
Magazine series) you will see that the result is not FM at information
bandwidths.

For better performance, it is highly desirable to use electronic
tuning of the resonator rather than rely on what is basically a second
order effect in order to modulate them.
Again, it must be remembered that I did the project as a

<my previous writing follows>

: >demonstration of the utility of microwave and directional antennas for
: >highspeed digital networks rather than as a recommended implementation.

: As my answer to the interface problem I designed a little circuit to replace
: the 20 pin hydrid on the ARCNET boards found in this part of the world. I
: hoped 2.5 Mbps NRZI would be within the capabilities of the link. I've
: never found time to test it. If someone would like to try this approach I
: could see if I could get the schematic into some sort of net compatible
: form.

I'm confident that the link I showed will run at 2.5 Mbps with typical
microwave sources.

The DoD has several PR developments underway. For HF, there's
Fed-Std-1052 (working prototypes); for VHF, there's Mil-Std-188-220A, and
for UHF satcom, Mil-Std-188-184. Nato (SHAPE Tech. Centre) is also
testing an advanced HF PR protocol.

I desire to link my home PC LAN to my lab LANtastic server LAN.

The tentative plan is ethercard into microwave gunn xmtr to exchange
SPX/IPX LAN packets embedded in TCP/IP frames.

Has anyone ever tried this?

Any published articles on homebrewing 2-way half or full duplex hi-speed
(56k-10Mbaud) digital RF packet links?

What amateur bands would allow such wide modulation?

TIA & any info/Inet sources appreciated.

The RF-sensed carrier detect may not be sensitive enough to consistently
indicate a carrier even when a signal is present at adequate quieting
to be demodulated by the modem.

That's true, but the fact is that it isn't very sensible to attempt to
share a frequency between multiple modes in the first place. People
do it, but it is always less than optimal.

Well, you could as easily say that receivers with slow squelches
should either be modified or not used. The 56kb modem (original
kit) uses carrier squelch, and it isn't slow. In fact, carrier
sense is faster than a state machine DCD would be since that
necessarily requires several bit intervals before it can act.

A PSA sound card (Orchid, Echo, Cardinal) which uses the Analog Devices
ADSP-2115 DSP will do what you want. In theory, you could use the SB, as
it has an SGS-Thomson DSP core in one of the chips, but no one knows how
to program it.

The KAM Plus only does packet on the VHF port. But if you want to use the other modes on a VHF radio, you can always hook the HF port to the VHF radio.

That's pretty trivial, Jon. All you need is a duplex radio connection
of telco grade. I've got that with the 902 MHz duplex radios I bought
off the power company when they switched to fiber. As far as the fax
is concerned, it's on a telephone line, and can train and transmit
just the way it does on the phone. The training cycle is the catch,
of course, and is why unmodified G3 fax can't be sent over ordinary
half-duplex channels.

>
>Or can I get one super TNC and cable it in a way so both radios
>can use it?

If you're willing to forego satellite, then a Kantronics KAM is
the answer to your requirements. It can do VHF and HF simultaneously.
But if you want satellite capability, that's not the way to go.
The better approach is two separate dedicated systems. I expounded
on this in another post for satellite. For HF, the KAM is still an
option, though it doesn't do Clover, or many of the utility signals
outside the amateur bands. There are better SWL boxes for that. But
the KAM is still a good start. It can do RTTY, AMTOR, PACTOR, GTOR,
and packet (and makes a half-hearted attempt at CW).

AEA's PK-232 can copy a few of the utility signals the KAM can't
handle, but it can only do VHF or UHF one at a time, IE you have
to manually switch back and forth. It *can* be fitted with satellite
modems via a kit from TAPR, however, while the KAM can't.

The ideal system is DSP, able to be configured on the fly for all
the various signals. AEA made an attempt at that with their DSP
boxes, HAL's DSP card does too, but neither do *everything*. You
can program your own DSP modem on one of the cheap DSP evaluation
boards, however, or on TAPR's DSP-93 plug in card for the PC.
I think that's the best approach, if you're willing to learn DSP
programming.

655. Mac/Ham Users Group

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-01-31 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-3101961820310001@wd1v.mv.com>
Source record: 38935

"Macnet Roster" (ver. 730) has just been updated and is now a stand-alone application! The version number = the number of hams using Macs.

"Macnet Roster" lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster":

Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

Or connect to my home page via the WWW

http://www.mv.com/ipusers/wd1v

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

From: cwm3@psu.edu
Message-ID: <cwm3.38.311057B3@psu.edu>
Source record: 38848

Hi and thanks for reading this.

I recently upgraded the W3YA packet BBS from v5.15 to v5.15c of the F6FBB software. The problems I'm having are as follows:

1. When anybody replies to a message using the SR command, the system generates a Ping-Pong warning message to the SYSOP.

2. The Multi server kills messages addressed to it or to names that have .DAT files associated with them but it doesn't make copies addressed to the intended recipiants.

Neither of these were problems before the upgrade.

Any help would be greatly appreciated. Please e-mail replys to cwm3@psu.edu.

Thanks, Chuck - K3CM

Tony,

Thanks I will set up my NOS to try this. Have you ever tried connecting to a TCP / IP station using procomm using the KPC-9612 ? Using mY PK-96 I can do stantard AX 25 connection to a TCP / IP station, am able to see and use thw BBS mode. I use the MProto command which allows for I and UI frames to be seen. Like doing a TIP session and having the modem in verbose mode. I was not able to do that with the KPC-9612. In a fax from Kantronics, they said it may not work, and I very well would need to use TCP / IP. I was doing some testing on a radio yesterday and did not have time to set up NOS nor knew how to utilize the second port.

Chris,

I have the same problem with my Omni VI and various accessories such as my computer, my voice keyer and ANY TNC plugged into the radio. I guess you have discovered that the mic audio is great when nothing is interfaced to the radio and that you experience severe clipping and RF induced distortion when accessories are connected - this was certainly my experience.

The Omni has a very strange audio input design which is a fixed gain preamp on the input that distributes the input (mic) audio to other subsystems in the mic audio path. If you have ever tried to use a microphone other than the amplified mic that Ten Tec sells, you will have noticed how sensitive and extremely critical the audio input control is to get clean audio. All of the audio input circuitry is on the board where the trouble connections are i.e. computer I/O, audio in, audio out, FSK in etc.

My best guess is that the circuit board is poorly decoupled and ANY conducted RF on those external accessory connections (ground included! is going to raise hell with the Omni VI SSB audio. I was able to greatly reduce the effect by

a) disconnecting ALL accessories (not acceptable)

<<< or >>>

b) RF grounding every radio & accessory to the station ground window & using separate AC power supplies for the TNCs instead of station DC power & using toroids on each accessory cable up close to the Omni VI and lastly using the Ten Tec microphone instead of the Heil headset, various electrets and dynamics.

I have not notified Ten Tec of this since I doubt they can fix the existing radios economically. Experiment with one thing at a time and let us all know what your problem / particular fix approach turns out

to be. I am really interested to find out!

Source record: 38854

Hi to all!
I am the proud owner of a new Kantronics KPC9612 TNC and am having problems in getting it to operate in KISS mode for JNOS110 or whatever else requires KISS mode for packet (BPQ code for example) It operates wonderfully in standard AX25 mode but NOT in KISS mode. Have given it the commands:- INTFACE KISS
RESET
and that doesn't wanna work.
I tried giving it the command INTFACE TERM
INTFACE KISS
RESET (in KAM
units, the RESET command just does a software reset whilst the command RESTORE DEFAULTS does what a RESET in other TNC's does).

Anyway, I was hoping that some kind soul out there in INTERNET land might know an email address for Mr Kantronics or his http://www.xxx.xxx page/s if he has one so I can write him and pick his brains thataway. Any ideas youve got re my problem would be most definitely appreciated. Email me at the address below.
Thanks,

Best 73's de Bob

671. TNC2 PCB layouts

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-01 00:00:00 UTC
From: djl102@unix.york.ac.uk
Message-ID: <4eqgj1$eth@netty.york.ac.uk>
Source record: 38855

Hi all,

does anyone know where I can get images of the pcb layouts for a tnc2 eg
a BSX2, G8STW, TNC2DL etc?

Thanks.

Message-ID: <4er8re$18vo@chnews.ch.intel.com>
Source record: 38858

1) will this help get rid of noise on my ICOM R71A caused by
my computer?
NO!
2) what gauge wire should I use?
As large as possible
3) what length of ground rod should I use to see some results?
As long as possible

Grounds are always a GOOD idea, for the will balance everything
in you shack, providing "everything" is tied to the same
common ground. However for interference you will have to choke out
the noise at the source, in your case, your computer. I would
suggest using iron core toroids on all the computer I/O cables.

Good luck, Tom...

675. Free Mac TCP Software + FAQ

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-01 00:00:00 UTC

Source record: 38859

Free - Latest Release of Macintosh TCP/IP software for Amateur Radio

NET/Mac v2.3.56 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Fixes for AddResMenu() bug in System 7.5.3
- Implement 'whenquiet <command>' command
- Implemented some temporary mods to keep track of sleeping sessions
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft

NET/Mac includes interactive HELP if you are just starting out. I also include
a TCP.FAQ (Frequently Asked Questions) that even includes names and addresses
of regional gurus and a "by the numbers" list of what you do to get
operational.

Send me (1) one FORMATTED disk and a *self addressed and *STAMPED disk mailer
marked TCP/IP... 800k or 1.4 Meg disks are OK but they MUST be formatted.

>Question: which TNC? I would like to do satelite work......not

When you are not interested in writing your own software but want a
plug-and-play setup, you need to get a PC. All the mainstream packet
software for use on the satellites is written for the PC.
(DOS or Windows)

Sure, programs exist for other platforms (I wrote one for the Atari ST
and someone else did one for Linux), but 99% of the users on the satellite
won't know what you are talking about when you try to discuss problems
etc.

677. New on packet. A few questions.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-01 00:00:00 UTC
From: scicon@ix.netcom.com
Message-ID: <4er55u$6vg@cloner2.ix.netcom.com>
Source record: 38861

I don't use packet very often. Mostly I just check into the local DX Cluster to see what's going on. I have a few questions about using packet in general.

1. When I long into a BBS via packet, it is very slow. Sometime it can take ten or fifteen minutes just to write a screen full of data on the screen. The BBS offers several text files for downloading, but if I take the time to download any of them, I will be on the board for hours. Now, if everyone is in the same boat, no big deal. But I always wonder if there is something wrong with my system, and that I'll tie up the BBS and the packet freq. if I try to download.

2. Is it allowed to link up several digipeaters? I have heard that more than a couple linked up really hogs the frequency, but I have also heard of people linking up dozens of digipeaters to see how far they can get, or to get into systems with special features.

3. I use Baycom, and I would like to buy a standard TNC and software to replace it if it will make a difference in the response time. I have heard Baycom works just as well as the others, just not as many features. Is this true?

Thanks for your comments.

Dan

It's a method, but it's a really bad one. alt groups are impossible to
get rid of so there is no such thing as 'moving' a group to the big-8.
Also, alt is supposed to be a hierarchy that stands on its own, not
a test bed for the big-8. A better idea would be to create a mailing
list and then cut it over to a news group if there is sufficient interest.

From: tracker@indirect.com
Message-ID: <tracker.42.001BBD6A@indirect.com>
Source record: 38865

Dan Rockhold, AB7AS and Mark Sunders, KJ7BS are looking for a location in North Dakota from which to operate AB7AS during the 1996 ARRL November Sweepstakes.

If you are not a contester or know someone who is not a contester, and would be agreeable to having 2 guest operators for the contest, please respond!

We are in the planning stages for this expedition, but we need to get a location very soon.

We are interested in the station equipment, especially the antennas. We can bring out own radios, power supplies, computers and interfaces, if necessary. However, we can not bring the antenna farm, too.

The station owner is more than welcome to join us in out endevor, or just watch, keep up awake, or what ever. WE WANT YOU TO BE PART OF OUR TEAM. Our goal is NOT to win the contest, but to have a good time and gain new operating skills. From Dan's home QTH in Phoenix, AZ, we got all but 7 sections in the 1995 November Sweepstakes. We do have a lot of fun with this hobby.

If you are interested, or know someone who is interested, please contact me or Dan at one of the addresses below.

I disagree with your statement about the use of a packet
regenerator at a duplex digipeater site....

Instead of using analog voice systems, use of a regenerator would
1) ensure that only packet would be passed thru, not voice
2) allow the system to use ANY freq available for packet use NOT
just the rptr subbands on say 6 or 2mtr...but the entire band!
(voice rptrs are limited to the rptr subbands....packet digis
either simplex or duplex are not)
3) using a VOICE rptr channel for packet is poor spectrum
usage...it would be wasting a rptr channel that voice users could
use...
4) the regenerator would clean up any noisy signals and
retransmit them clean for all to copy.....plus no loss of data
because of poor audio quality on a voice rptr would occur in a
true digital sense!

Is that using some public key encryption technique?
If not, what is preventing the malicious from cloning one of the
apparently valid codes?

Also, what is preventing the malicious user from just keying up over
other people's transmissions, thus rendering the repeater useless?

Fortunately, most idiots can be convinced to rip out the "DCD mod"
or "software DCD" or whatever they have by just slamming their signal
with enough power at higher speeds so that they see the disadvantage
themselves.

As explained before, the only alternative to running multiple speeds
is to use only 1200, and that is certainly the worst of all.

This is very unlikely for the AFSK-FM system that the state machine DCD
is usually used for. A noise detection circuit (like used in most
transceiver squelch circuits, only with shorter time constants) detects
the carrier way before it can be AFSK demodulated using commonly used
MODEM chips.

>>The point in having multiple modes is to allow the use of older, slower,

>That's true, but the fact is that it isn't very sensible to attempt to
>share a frequency between multiple modes in the first place. People
>do it, but it is always less than optimal.

It depends on how you define "optimal". When cost and bandplanning are
also taken into account, it may well be better than running multiple
modes on different frequencies, and "optimal" given the restrictions.

(over here, all packet channels are in a single 400 KHz band segment on
70cm, and it is thus quite unpractical to run two systems on two different
frequencies at a single site. also, many groups just don't have the
cash available to set it up, when it would be possible. under these
circumstances, running 1200 plus some higher speed on a single channel
is better than running 1200 alone. it provides a migration path, and
1200 can be turned off at some time, as has been done at several sites
now. this would not have been easily accepted when the 1200 mode was just
replaced by something faster on one day)

Hmmm... it looks like HDTP (or equivalent of the FCC) does not put
out such drastic sanctions.
Normally one will lose the license for a year or so, and one could get
a fine of maybe $500.

This does not seem to stop some people... when you have been reading the
BBSes, you can see that the wellknown person that causes havoc on the
local packet network is still active. He is fully known by name,
ex-callsign, and address.
(he just uses callsigns of other people, mainly VERON officials, to
post offensive messages. he was also active on the phone repeater sometime,
transmitting over those same people, but I think he has lost interest in that)

Hi Bill! Yes, us old geezers should help each other (licensed mid
1966). Can't help a lot with actual HAMCOMM but having had it on my
VDU screen a couple of times, I'm fairly impressed.....!!
BUT (!!!) the nice thing about the very simple 741 op-amp modem
circuit you get with the software is that the same darn thung can be
used without modification to send and receive Slow Scan TV using JVFAX
vers 7.00. And in full color on your VDU screen. Just listen on 14.230
most days and hear the SSTV guys chatting and SSTV'ing away to each
other sending pictures of themselves, their QTH's, their wives and
their rigs. Nice stuff, Bill. JVFAX uses exactly the same HAMCOMM
modem and wiring. Just load it, configure it and watch all da' pretty
piccies..... I am not there, transmitting, (YET) as my class of
Australian ham license doesn't permit operation in the 20 meter ham
band but do listen a watch the pretty SSTV stuff.
Hope you have fun,
Best 73's
Bob.

>old geezer to get his feet wet? Any experience with this software, both pro
>and con, would be appreciated.

I built the modem as per the circuit that came with the HamCom software
and found that it was almost useless.Using a single opamp to change a signal
to a square wave especially on hf is not the way to go.I have since seen an
update to this circuit but have not tried it myself.Prehaps this modem was
included so people could evaluate the software.I understand the genuine modem
(as supplied by HamCom?) is a little more sophisticated.Has anyone else been
down this road?

Hi Lorrin!
Well, in answer to your question, there are, in most countries due to international law, some problems on allowing unlicensed non-amateurs access to packet radio or to ANY amateur radio frequencies by ANY mode whether it be Packet Radio or whatever. The Administrations (Governments) of the world have agreed, in Geneva, Switzerland, that a formal qualification in Amateur Radio shall be required BEFORE allowing transmission on any of the ham Bands. Besides, if you're accessing the hambands by phone or by whatever other means you WILL require an Amateur Radio Callsign issued legally by the proper adminstration in your country. Try going on air without one of those or with a bogus one and you'll get, generally, the very Cold Shoulder Treatment from the Amateur Operators around the world. Plus the fact that, in most countries, the amateurs are licensed to have communications ONLY with other licensed amateurs and, to allow you on air, directly or indirectly, by phone or by direct operation of amateur equipment, will be asking the guys you're contemplating contact with to breach the terms of THEIR own licences and risking a heavy fine or jail for yourself..... (In Australia, its $10,000 or six months jail is you go on air without a licence....)

It IS the ONLY hobby in the world for which you need a government license..... Its the ONLY hobby in the world for which governments have had to make special international treaties..

There it is, looks like you'll need to do the study in radio and electronics, do the ham exam in your country and get a valid callsign then play to your heart's content. Contact the Licensing Authority in your country and they'll no doubt guide you to a place where you can get the required study and the examinations in the theory to get on air.
Sorry if this souds a bit pompous above but the guys worked very hard for their licences and probably will give you a hard time if you attempt to get on air without doin' the study and the legal bits as well. The FCC in the States is the Authority there and, similarly, in Australia, its the Spectrum Management Authority, not that the lastmentioned is likely to be of much help to you if you live elsewhere. There WILL be an appropriate Governmental Authority in YOUR country. Just look 'em up in the telephone directory. They often have licensed amateur operators on their staff who will be PLEASED to assist you........

If I can help (if the pompous stuff above or the size of the task
doesn't deter you), please email me direct as per the .sig lines
below...

>Has anyone experienced a similar problem?
>
>Mike Bunney

Hi Mike.

First check the i/o baud rate in the TNC, if it is over 9600, it will not
work thru an UART 8250...maximum is 9600. If it is set to 9600, and you
have a DOS machine, type "MODE COM1: 9600,E,7,1" then enter. This will
let DOS configure the port...in this case...to 9600 baud with even parity,
7 data bits, and 1 stop bit(s).

All I can think of...hope it helps, & good luck. :)

>

Every radio has a "unique" pattern when you key it (due to differences
in the components etc), this pattern can be used to identify a radio.
There is no encrypted signal or anything that fancy.

One of the repeaters that I used to monitor had a tx-id system on it,
if you ker-chunked the repeater more than 3 times in a 5-10 minute
period, it would lock you out for a couple of days. It was also used
to track stolen equipment (you had your tx "fingerprinted", then when
the tx got stolen, you just let one of the ops know and the repeater
would advise you when it heard that tx (if it heard it)). They, also,
could (and did) blacklist certain radios.

>Also, what is preventing the malicious user from just keying up over
>other people's transmissions, thus rendering the repeater useless?
>

This is one of the weaknesses of the system, another is changing the
rig, or swapping a couple of components in the tx (changing some of
the resistors/caps is usually enough).

If someone really wants to get around the system they will.

regards,
Dean.

> Gary

Here in Europe we don't have the resources the USA amateurs have. Like
only 2 MHz on 144, no 220 MHz, only 10 (6 within some time) MHz at 430 MHz.

Sharing modes is the only way.

An idiot using a 1200 bd TNC which only detects 1200 bs traffic is not
only antisocial, but also illegal : there is a big chance he is distubing
other traffic. Most packet operators keep the audio switched off. What if
by some glitch the transmitter turns to the local phone chat frequency
and goes on transmitting over a current conversation ?

Joop, pe1dna

Yep, it used to drive me nuts when I started monitoring RTTY. I soon found out this is a scrambled NATO system (typical shifts are 840, 844 or 850 hz). You'll find it all over the HF spectrum and don't even DREAM of getting any legible results. Same applies to many Russian RTTY systems, such as the one with a 81 Baud speed and small shift.
You may also come across 75Bd systems with a shift of about 400 Hz which will be legible only some of the time (fregs a.o. 7804, 9044). This is a diplomatic network; scrambled messages are preceded my a string of numbers followed by xyxyxyxy, xpxpxpxp or other 'x' strings, after which the scrambling begins.

From: "Gary P. Fiber" <gfiber@halcyon.com>
Message-ID: <4et3a3$pc6@news.halcyon.com>
Source record: 38749

With most Amateur radio equipment today the problem is not poor decoupling but the accessory input is high impedance, this provided no loading and no path to ground for thr prevailing RF that is in the radio room. Using the mic input which is usually 600 ohms or FSK connections are the prefered methods of connnecting external devices. Some times you might try a matching transformer in the audio circuit it hekps on Yaesus radios.

The 600 ohm mic input generally willlprovide a sufficent load to the incoming TNC audio, and inpressed RF will usually go to ground.

You can get the kernel patches and AX.25 utilities from ftp.ucsd.edu
in /pub/hamradio/packet/tcpip/uploads. This is where the latest stuff
can usually be found. There is an archive called kernel-29 which has
the kernel patches in, and the utilites are in an archive called
ax25-utils or something similar. You won't need to patch your kernel
if you're using 1.3, as support for AX.25 is included in the distribution
source. You might want to get the net tools available from the same place,
which have support for AX.25 particularly 'ifconfig'.

Hope this helps.

Cheers and 73, Ian G0TLB.

Message-ID: <4es2qc$7bl@alfred.acs.uwlax.edu>
Source record: 38876

Hello:

For those users who have the KAM enhancement board added to their KAMs, there is a modification that is supposed to improve the performance of the KAM to bring it upto the level of the new KAM Plus.

I inquired from Kantronics and they said that they do not support such modifications.

My question is has anyone done this mod and how dies it work. In otherwords is it worthwhile following up on. I do have the modification somewhere in the belly of my hard drive.

Comments would be appreciated

>being wireless)? Please let me know! I am very excited about the
>possiblity of a wireless connection.

Yes, you can run TCP/IP over packet, and yes you can better telco
14.4kb throughput with the WA4DSY 56 kb RF modem. The effective
throughput is about 4 kilobytes a second, IE about equal to a
28.8 kb telco link. Unfortunately, the cost of two stations is
going to run about $1200. You could do 9600 baud *half* duplex for
less, around $800 for two stations, but effective throughput is
similar to 2400 baud duplex telco modems.

I expect operating over the telco lines is going to be cheaper.
It should be a toll free call if the distance is only 3.6 miles,
unless you're unfortunate enough to be located across a toll
boundary, or are stuck with metered service. Otherwise you're
just looking at $22 a month for a dialup line at each end
and a pair of telco modems (28.8kb telco modems are now as
cheap as $149 each). You don't need a dedicated pair, that
gets expensive. Just use a dial up and leave it dialed up,
or set it up to dial on demand.

Gary

712. TNC/Comm Port problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-02 00:00:00 UTC
From: mbunney@bank3.u.washington.edu
Message-ID: <4etauc$cc5@nntp4.u.washington.edu>
Source record: 38879

My PK-96(TNC) has recently stopped communicating with the comm port on my 286 desktop. Now when I turn my TNC on, my cursor moves over one space instead of displaying the welcome message that scrolls onto the screen. I have checked cables, comm boards, port settings, etc. I did take the TNC to work and connect it to one of the computers there and it worked just fine. I tried another computer and it failed on that one. The only common thread to the comm boards that failed was the UARL chip set. The TNC seems to work fine on the "16550's" but fails on the "8250" chip. Has anyone experienced a similar problem?

>down this road?

I have had no trouble with the HAMCOM interface at all. Check the
power supply levels to make sure the handshake lines in the serial
port have the muscle to supply the OPAMP (I used the TL071).

It is quite possible to destroy OPMAMPs by taking inputs beyond the
supply levels. Since it is used in open loop mode, rather like a
comperator, you shouldn't have to use much RX audio at all to get it
to work, the ACC socket on the IC725 drives it nicely.

HAMCOM 3.0 is going great, with the exception of CW (use your
ears). Definetely the way to get started on RTTY and ANTOR in my
opinion. Or you could try your hand at HF weather fax with JVFAX 7.1.

Here's what a local repeater club in So. Cal. did:

-Changed the status of their repeater from 'open' to 'private', so that only club members are 'supposed' to use it.

-Got a restraining order prohibiting the undesired user from using the repeater.

The restraining order was enforced & the undesired user was forced off the repeater, along with lots of 'good' non-member users.

Friend,

Freebie - a full function stand alone IBM compatible Radio Station database program to anyone who is interested. Contains 4,000 plus records. Sorts by name, freq, time, language, country, continent.

To get it send you POSTAL ADDRESS as well as you EMAIL address for registration. The program will be sent back to you within 24 hours via EMAIL. I may contact you(only me) in the future via Post with information on other programs available.

Please send your request to chuck@flinet.com.

Hope to hear from you

Chuck Bolland

Hello Pete.

Check out the TNC-Radio wiring diagrams at
http://www.idir.net/~medcalf/ztx/wire/

The HK-21 is there as is the HTX-202 and many others.

720. APRS Beacons

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-02 00:00:00 UTC
From: grc@arn.NET
Message-ID: <1.5.4b11.32.19960202160812.00687828@mailbox.arn.net>
Source record: 38887

I am interested in getting some feedback from some of you who have been active on APRS in your area. Several of the local guys are running APRS. They beacon constantly, like every 10 or 15 minutes. They beacon via WIDE, APRS, APRSM, GPS, and other paths. They want all the area nodes to be set up with alternate aliases of WIDE, etc. so their beacons are repeated all over the country side.

Now, I understand that these beacons have to happen so their locations will show up on everyone's APRS maps, but I can't understand why they have to beacon their house position 4 or more times an hour! Surely their house isn't going anywhere! For mobile weather spotters, this is a great idea, but for home operation surely a beacon once every 2 hours (or every 20 years for that matter! -- just kidding on that one) is often enough.

Is this what is being done with APRS all over the country or is this just a local phenomenon? Please note, I am not anti-aprs. Also, it is their station and they can do what they want. I am more bemused by this than aggravated.

>The problem which he is having is that it comes up with Failed RX upcalls when
>recieving packets. Does anyone know what might be causing the problem?

I assume you are running NOS as a Windows application. If so, you need to also
run winpkt (or whatever it's called, I forget) or possibly the -w flag on
driver load.

What this does is move the driver to high memory, instead of having it floating
all over the place as Windows pages.

Just a guess...

I've run a similar setup for about a year, with the addition of
a g8bpq switch backend to the ethernet from a third machine, which
also talks to the nos machine.

Check that the required host names and ip addresses exist in
the appropriate files on each machine (autoexec.nos, \windows\hosts).

Verify that you can ping each machine from the other.

I found Microsoft's 32 bit tcp/ip fairly simple to get up and running
in WFW 3.11, but did not try any other tcp/ip stack.

Recently upgraded from wfw 3.11 to Win95, and everything still works
fine, using the networking built into Win95. Also have a ppp link via
a modem on the Win95 machine, and that works ok also.

TAPR's True DCD kit can be installed in a PK-88 - I've done it with good success. With a an eye to keeping parts low to the board, it can be fit within the case.

>the resistors/caps is usually enough).

Admittedly, I've never evaluated one of these transmitter fingerprinting systems myself, but I have a little trouble believing some of the claims made about them. For example, the claim that each and every radio

is uniquely identifiable, even radios of the same model and production run. Granted, variation in component values will result in slightly different PLL characteristics, but I have yet to see any evidence that suggests that the resulting fingerprint varies enough to be considered "unique". Also, component ageing and temperature variation can cause considerable drift over time, and I haven't seen any evidence that this drift isn't great enough to change the "fingerprint" of the radio.

Another factor worth mentioning is that the characteristics of a PLL may change considerably as you change frequency, due to variation in gain of the VCO. A fingerprint taken at 144.0MHz may not "match" a fingerprint taken at 148.0MHz, for instance.

I'm also interested in how accurate the software algorithms are that are used to compare a captured fingerprint with stored fingerprints. I can't help but speculate these algorithms generate a likelihood of match measurement, and some arbritary level is used as a decision point (like, say 90% likelihood of match). Too loose a standard and many radios will match one fingerprint, too tight a standard and one radio won't match it's own fingerprint from one day to the next (or even one frequency to the next).

I've worked with people that built radar-signature analyzers (part of an electronic countermeasures system) and they indicated that the signature of a model of transmitter was very consistent from one unit to the next. Granted, radar transmitters are different than PLL controlled transmitters, primarily that a radar transmiter signature consists of both amplitude and frequency variation and a PLL transmitter signature is composed of frequency variation, but the fingerprinting technology depended on a high degree of consistency from one unit to the next.

Every time I bring this up, I get a handful of mail messages from people saying "we have it and we swear it works", and I think the concept is really neat and I'm sure there are some neat prototypes. I'm just not convinced the people using this technology are completely aware of how it works, and/or being completely honest about how well it works. I'm curious, and want to research it more sometime, and it would be neat if could discuss this technology objectively without immediately descending into an unrelated thread about repeaters, jammers, scumbags and the FCC.

Please note that I trimmed the Newsgroups: line, and have set the Followup-To: line to rec.radio.amateur.equipment.

It will be interesting to see how long it takes before it becomes
a "difficult to get" item, now that TI has taken the device out of
production.
(at least that was announced to happen last year)

From: rdavis@nyx10.cs.du.edu
Message-ID: <4evkn4$l37@nyx10.cs.du.edu>
Source record: 38762

Regarding FCC announced fines.

I have read of this for years, but never actually heard of such a
fine being collected by the FCC.

With all those "notices of forfeiture" ...
has the FCC _ever_ actually collected as much as one dollar
of any of the fines they have levied against Amateur Radio
operators who have violated the rules?

A background note ... my (former) source at the FCC, who no longer
works there, told me in early 1993, that as of that time,
no such fine had ever been collected.

So the question is for the time from early 1993 to now, early 1996.

What you describe sounds like encrypted (aka 'crypto') military
traffic. If so, you can forget about decoding it - it's simply not
possible without the correct key and equipment.

At a recent Hamfest was able to pick up about 15 GE Master II low band radios and 5 Motorola Low Band units. We are first working to convert the Master II's first. Question we have is in regards to the temperature controlled crystal units (ICOMS). Does anyone have any experience in constructing the ICOMS or know of a source for the ICOMS so the units could be used on 6 Meters. Would appreciate any information!

738. Linux and Digital modes: my experience

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-03 00:00:00 UTC
From: Dave Skarbowski <skarbows@ptd.net>
Message-ID: <311395C6.2BA09FD0@ptd.net>
Source record: 38768

From time to time I see messages posted requesting information on terminal programs available
for Linux. I'd like to start a thread on Linux and packet (or rtty, or anything else to do with Linux and hamradio). So far here is what I have tried:

1. The AX25 kernel support. Works great! I have kernel version 1.3.59 (+patch) with all the latest AX25 tools and I must say it works great. We have a local tcp/ip net on two meters witha POP server for mail. Even Netscape works great for retrieving POP mail over AX25.

2. TNOS. Also works great but just the plain old AX25 tools and AX25 kernel support seems to
give me the features I like. I don't want to be a BBS and that's where TNOS shines.

3. RTTY. This was a tough one. I really like XPKAM under dos for HF RTTY and Pactor. I couldn't find anything for RTTY in a native Unix port. Enter DOSEMU. I finally gave in and tried the latest and greatest DOSEMU. It works! XPKAM (and other terminal prgs) work pretty well under DOSEMU with some trial and error parameter setting. I find I need to set DOSEMU's
hogthreshhold to 0. This makes the rest of X slow but still usable. I guess if you run from the Linux prompt this doesn't matter.

4. Could I also run Windows terminal programs? Enter WINE. OK, I have not had much success with WINE. Runs solitare real nice but all else is still pretty rough. Shows a lot of promise. I just downloaded the latest source....dated Jan 31, 96. I have yet to give it a try.

So, what have you tried? I've got a ton of programs to try on the DOSEMU. Log programs, sat tracking programs, etc. I'll try more WINE (after 12:00 pm...but I perfer beer). I still have to try the PMS that comes with the AX25 tools. There's only so much time in a day to hack...

>isn't going anywhere! For mobile weather spotters, this is a great idea,
>but for home operation surely a beacon once every 2 hours (or every 20 years
>for that matter! -- just kidding on that one) is often enough.

The reason a fixed location needs to beacon is so that new stations coming up on the net will learn the location of the fixed station. Now the question becomes, how long do we want a new station to have to wait before its map is fully updated? Obviously, beaconing once every 20 years is out of the question, is two hours out of the question too? Maybe, if the net is "leaky". Remember, these are UI frames, they can easily be lost or corrupted, so several beacon transmissions may be necessary before there's a reasonable assurance that all monitoring stations on the net have copied it successfully.

On a simplex network that extends beyond the local radio horizon, each hop's success probability has to be multiplied by the proability of success for each of the other hops to get a pass thru probability. Suppose each link has a 0.8 probability of success for any given beacon. A net with 4 links will only have a 41% probability of successfully transferring any given beacon. So you'll need slightly more than two attempts to have a reasonable assurance of success. If you want maps to update within a half hour, you'll have to beacon every 15 minutes, if you'll accept a wait of 2 hours to update a new station's map, then beaconing once an hour will do, etc.

For a closed network, where all the stations are always present 24x7, fixed stations needn't beacon at all, but that's a rather uninteresting use of APRS. A paper map would do as well. By nature, APRS maps are dynamic, the question becomes how dynamic should they be? I don't have a good answer. I'd suggest "it depends" is probably the only appropriate answer.

>by some glitch the transmitter turns to the local phone chat frequency
>and goes on transmitting over a current conversation ?
>Joop, pe1dna

Yeah, good point, and a reason for RF DCD. But if the transmitter
glitches and comes up on the local chat frequency it will still
make life miserable for the phone ops since it'll try to send packets
between their transmissions.

I toyed with a varient of this problem a while back. I had a low usage
voice repeater that I wanted to share with 9600 baud packet. Carrier
sense was adequate to keep the packet system from transmitting over
voice users, but didn't solve the problem of voice users having to listen
to the packets, or the problem of voice users transmitting over packets,
or the problem of the packet system being held off by the repeater tail.

I came up with a scheme using CTCSS so that the voice receivers would be
muted when packets were sent, IE voice users used one CTCSS tone, packet
stations another, and the repeater regenerated either depending on what
was on its input at the time. So if voice users used CTCSS decode on the
voice tone, they wouldn't have to hear the packets, which transmitted a
different tone. If the voice CTCSS was detected by a packet station, it
would honor the carrier sense line and obey the tail. As long as voice
users didn't allow the repeater to drop, no packets would be sent that
would delay their conversation. But if the packet station detected a
packet CTCSS, it could respond immediately on the cessation of the tone,
so that the long tail delay didn't slow packet usage of the machine when
voice users weren't present.

This doesn't address the problem of voice users keying up over a packet, though a decoder could be used on the voice radios to prevent them from keying when a packet CTCSS was detected (I figured that was too clumsy). It does give the voice user priority, which is probably best since voice usage is usually realtime while most of packet operation is not.

I eventually gave up on the idea for two reasons. First, voice usage of the repeater became heavier, and second, getting packet operators to install CTCSS and honor it proved to be a difficult political problem. As I mentioned previously, it only takes one non-conforming station to seriously degrade the entire system. (A technical problem was the packet CTCSS tone degrading packet demodulation.)

Fortunately, we here in the US *do* have adequate spectrum to segregate various uses on their own channels.

Sure!

Standard Group III fax at each end of a HF radio link. Fully automatic
operation at both ends.

Codan Pty. Ltd. (my employer) produces such a system. It is of course a
store-and-forward system and you can send a typical fax in less than 5
minutes.

Now I know how sensitive Internetters are to commercials, so if you want more
info, email me on rsilva@adelaide.dialix.oz.au . If you ask nicely, I'll even
tell you about the competitor's products :-)

...

For around 6 months I had my linux box attached to a TNC in
transparent mode. This is the simplest (albeit least flexible) way to
put linux on packet.

To make it work for the typicial packet user I had to patch n_tty.c to
do the \n to \r conversions.

As part of the deal I have everyone's .procmailrc pointing back to my
account so I can vet the incoming mails for rules compliance.

A couple of weeks ago I replaced linux with FreeBSD on that box, in
much the same configuration (except the \n to \r conversion patch was
applied to tty.c). It works a little better only because the FreeBSD
getty sees the CD transition to TRUE so the login prompt comes up when
someone connects. Probably could have done something more
sophisticated with mgetty on linux but never got around to it.

From: Christophe Suarez <f5pgp@babel.asi.fr>
Message-ID: <4f2d53$2fu@s2.asi.fr>
Source record: 38782

WinLink is not a real gateway software, it is used to forward messages
from HF to VHF/UHF and reciproqually and somebody who links an
HF pactor port for example can't link the packet VHF port. Bulletins
are shared and can be read from any port.

753. Help with linux slip > ka9q > tnc

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-04 00:00:00 UTC
From: seymour@montana.com
Message-ID: <4f1348$7pf@maw.montana.com>
Source record: 38783

I am having problems setting up slip to talk to another machine running ka9q net/nos which is attached to a packet tnc. I am using slattach in slip mode. Everything seems to be configured correctly according to ifconfig, route and netstat. I do have a dip connection to the net that is working. I get no indication that the computers are talking to one another via the slip line. I know the hardware is correct because they talk to each other via net/nos if running on both machines. Ultimately, I want to be able to allow local packet
users to access the net via net/nos and Linux. Interrupts, com base addresses, IP addresses and such have all been checked and double checked. Any ideas why this is not working?

please respond to:
seymour@montana.com (KG7NN) in Victor, Montana.
(sorry, no packet system here in this neck of the woods!) (yet)

755. BPQ - Net/Rom matrix problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-04 00:00:00 UTC
From: w6go@netcom.com
Message-ID: <w6goDM8s2D.LEE@netcom.com>
Source record: 38785

Are you using the VE2BMQ RS-232 Timeout Timer (from Amateur Networking Supply) between a G8BPQ node and a NetRom diode matrix? If so, read on. This may apply to you!

The timer does a great job of disconnecting the computer from the matrix either when the computer is not active or if the computer crashes. The timer doesn't protect you from all possible computer failures, however!

K6ANP has a "node stack" which provides user connects to a distant PacketCluster node (W6GO). He runs G8BPQ in a local computer to provide a local connect path and for administrative purposes. He uses a VE2BMQ timer. All was working fine until he shut off his computer. Then, nothing would go through his matrix and his TNCs couldn't communicate with each other through his matrix.

The computer, when powered down, effectively shorted its data input lead to ground. The diodes in the matrix then clamped the data level to less than a volt, and no data went across the matrix! The VE2BMQ timer protects the matrix from input from the computer, but it doesn't interrupt the lead which carrys data to the computer. You wouldn't want it to!

All that was necessary to correct the problem was to place a resistor in series with the data input lead to the computer. Experimentally it was found that 300 ohms (in this particular case) allowed data to pass to the computer and when the computer was off, allowed the data to pass between other TNCs on the matrix. This value works fine even at the K6ANP matrix speed of 38400 bps.

A similar test here showed the data level also pulled down, but apparently not enough to be a problem. The situation seems to be hardware specific and may be different for each application.

The bottom line is: If you connect a BPQ computer to a NetRom matrix through a VE2BMQ timer, be sure to see what happens to your matrix when the computer is powered down and still connected. You may be suprised!

I too can attest to the helpfulness of the TX-ID system. Coupled with our
Doppler Systems DF gear, the TX-ID has allowed us to bag several Drew-like
scumbags here in the RI area who have no appreciation for Part 97.

Source record: 38787

In article <4eu2ac$lls@news-s01.ny.us.ibm.net> dblanco@ibm.net (Carlos Blanco) writes:
>Please, I need to Know about TNC's maximun speed, Types & models, and prices.
>Also where I can buy them.
>
>It's possible to find a 19200 or 28800 TNC packet modem for 2m or 430MHz?

TNCs have two relevant speeds, the radio baud and the serial link baud.
The two can be (and usually are) different. The original TNC2 style TNCs
require a minor modification to operate faster than 9600 baud on the
serial link side (they use an opamp for the serial driver, and its slew
rate is too little to handle faster data, you just swap in a faster
opamp, a TL084 is recomended).

19.2 kb is about the practical limit for the serial port, though some
TNCs now support 38.4 kb. That's because the *computer* serial port
becomes a bottleneck at faster speeds due to the need to service it
on an interrupt per character basis. For faster communications to the
computer, a plug in card, such as the Ottawa PI2 or the Gracilis PacketTwin,
which have DMA, is recomended rather than using an external TNC. (Though
there are now "smart" serial cards that can support faster serial comms
by buffering. They pose a problem, however, because they can't reliably
signal the processor when a packet is complete. The two cards mentioned
above can, offering an interrupt per packet to the host processor.)

On the radio side, the limit is on the *modem* used. The default modem
included in TNCs only does 300 baud Bell 103 (for HF), and 1200 baud
Bell 202 (for VHF). Some TNCs now offer a 9600 baud G3RUH style modem
as well. For faster speeds, you have to add an external modem. Modems
up through 56 kb are available. At 56 kb, however, you run into a
"horsepower" limitation with most TNCs, IE they can't handle the
data fast enough and start to drop characters, which of course corrupts
the packet. There are ways to modify some TNCs to run faster, IE faster
processor, SIO, RAM, and clock crystal, but you're better off going to
the plug in cards when you reach these speeds.

There are two standalone TNCs fast enough to service 56 kb off the
shelf. These are the PacComm Spirit and the Kantronics Data Engine.
They both still have to contend with the interrupt per character
bottleneck to the *computer*, however. If you've got a Mac, or a
PC with a "super" serial card, these will work for you. Otherwise
I suggest one of the plug in cards. (The Mac is special because
it uses an 8530 as its serial chip. That offers it a built in
advantage for high speed serial data, such as Appletalk, or high
speed packet).

>Hi Robert, I also have a kp9612 and would be interested in hearing about an email address for
>kantronics. Have u managed to get 9k6 working on it?? I have failed and got no reply to my fax
>for help.!!

The web page for Kantronics is www.kantronics.com, but there isn't much there except Email addresses for sales and support.

What *exactly* seems to be the difficulty with 9600 baud? I have the KPC-9612 and it works fine with the *proper radio*. That's the key to 9600 baud success. Most amateur radios just won't work right for 9600 baud packet. Either their Rx bandpass is hosed, or they have poor TR and receiver recovery times, or the PLL loop *cancels* part of the 9600 baud modulation.

To work, the radio needs

1) True FM modulation (no phase modulators)

2) No PLL in the modulating loop (crystal control or IF modulation only)

3) Flat phase response in the receive IF filter (usually means a *wider* than stock filter to achieve this since filters get very phase non-linear near their edges)

4) Fast diode switched TR (though reed relays can be fast enough too)

5) Fast receiver recovery (really really important, and often overlooked)

6) A way to tap *directly* into the modulator and demodulator bypassing all audio processing circuits

Only a few radios meet these criteria fully. Many that *advertise* 9600 baud capability lack some of these important criteria, and won't actually work properly. A couple that do work properly are the Tekk KS900 and the Azden PCS9600D. The IC820H will sort of work, but you need to open up the IF bandpass for it to work well. Ex-commercial service radios like the Motorola Micor and RCA Tac700 can be adapted to 9600 baud too, though you usually have to open up the IF filtering. GE radios are phase modulated, so you have to fix that to convert them to 9600, but that isn't hard, just use the Channel Guard input. Again, the IF filters are too tight and need to be opened up.

In addition to the above, Kantronics and MFJ now offer crystal controlled radios designed specifically for 9600 baud data service. They work well as data radios, but they don't work quite so well as *radios*, IE they

croak when put on a high RF site. If you stack enough cavities in front of them, you can usually make them work.

759. HamComm 3.0 success story

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-04 00:00:00 UTC
From: kd7s@valleynet.com
Message-ID: <kd7s.24.002B3260@valleynet.com>
Source record: 38789

A couple weeks ago I asked for your thoughts on HamComm software for RTTY and AMTOR. I received quite a few responses and the overwhelming feeling was that this package is excellent. So, I heated up the soldering iron and built the interface. I had my first RTTY QSO about two hours after the last solder joint had cooled. What a thrill it was to explore a brand new mode (at least new to me) for such a small investment in time and money. Thanks to all of you who convinced me to take the plunge.

>
>Putting a packet repeater on the wasteland of idle voice machines
>sounds like a great idea. And it's totally legal as well. You'll have
>a ton of trouble with the ol' boyz repeater co-ordination clubs
>though.

Depends. SERA treats a repeater as a repeater (as they should).
Whether you want to use it for voice or data is purely the owner's
option. Now getting a *new* 2 meter repeater of *any* sort coordinated
can be difficult or impossible in some areas, but there's plenty of
open coordinations available on other bands. When I originally
coordinated my 70 cm machine, it was listed as *mixed* data and
voice usage. I later changed that to just voice, but that was *my*
decision, not SERA's. There's a 2 meter data repeater here in
Atlanta on 146.73 that used to be a voice machine but was converted
by its owner to be strictly packet. SERA only coordinates *frequencies*
for repeaters, what you use the repeater for is your business.

Well, that may be changing a bit. SERA now has pairs set aside
strictly for data, no voice machines allowed there. That's a new
part of the revised 70 cm bandplan. But as far as I know (and I'm
a SERA member) no use of nominally voice pairs for data has ever
been denied by SERA. The intent of the new bandplan is to make
sure some channels for data repeater use will be available and
won't be usurped by voice repeaters.

A repeater is a repeater, whether it carries voice or data, and
must operate in the repeater segments of the bands. SERA coordinates
all pairs in the repeater segments impartially. Simplex packet is
a thornier problem. That usage takes place in what has traditionally
been uncoordinated spectrum. SERA has opted to work with State packet
organizations to deal with this. Each State's packet group is allowed
to act as coordinator for simplex packet.

That's been rather informal in some areas, better formalized in others.
The problems of simplex packet coordination are quite a bit different
than repeater coordination because of the shared nature of simplex
packet channels. In a real sense, every packet user's station is a
digipeater. The approach the Georgia packet organization has taken
is to authorize LAN frequencies by geography rather than dealing with
individual stations. One designated node in each LAN then is authorized
to operate on the State 56 kb backbone to relay packets from one LAN
to another. That node is selected by the members of the local LAN
in consultation with the State group's technical committee. The

State group's "members" *are* the local LANs, IE each LAN appoints
two representatives to the State group.

That works pretty well, and tends to limit users from hopping from
one frequency to another, thanks to the geographical separation. They
stay put in their LANs and work out-of-LAN stations via the network
node in their LAN. That makes issues of routing much easier because
the network knows where to find any given station based on cluster
routing statements. At least it does if they use TCP/IP, the routers
are based on TCP/IP routing. The network nodes require source routing
if used for non-TCP/IP traffic, IE the user has to know the path
to the other station if he isn't using TCP/IP, the network can't help
him with the routing in that case.

I added code to Karn's NET (which was the basis of our original router
code) that was called "mulport". It attempted to aid the non-TCP/IP
user in navigating the State network by allowing him to only include
the destination LAN node's call sign in the digipeat field. The network
would then route (based on tables) the message from the local LAN to
the distant LAN. It worked, but we've abandoned that as too clumsy to
maintain. Now the user can use TCP/IP or Netrom routing, or hop from
LAN to LAN KAnode style via the AX25 interface of the routers.

Our repeater based LANs are using "side mounted" interfaces to the
network, IE they have a wired tap from the repeater data stream to
a co-located network routing node. That's not necessary, just convienent.
The network node could be anywhere in the repeater LAN's coverage and
work the same way.

There's a solution to this problem, it's called DAMA!
I'm sysop of a TheNet Node digipeater running a dual-speed (1200/9600)
user port on UHF, using a single TRX, but of course 2 modems.
Works fine for over a year now. Both 1200 and 9600 users are happy
with the system.

Yes, Hamcomm 3 works VERY well. Now, try a DSP-59+ unit in front of your
op-amp decode circuit and the recieve will work better than a pk-232 or
Kam-plus. This has been my experience....

Hello friends,

I have been trying to receives Weather Fax pictures from Offenbach
weather station in 134.2 Khz with JVFAX7.1 and Hamcomm interface,
and all I get is white little squares. I have tried all the modes
(including 120/576) without success. Any other frequency I try
apart from longwaves, gives me perfect results.

Has anyone succeded in receiving a picture from this station??
And HOW????

Please HELP.

Your fast reply would be much appreciated.

Best Regards
Demetre Valaris SV1UY

>
>
A domain.txt file should be in you jnos directory.

It is made up of all your local IP addresses and is referenced when you wish
to talk to someone.

At the very least you should have your own entry in it eg;

g7ltt.ampr.org. IN A 44.131.159.228

This means that the callsign g7ltt (me) has an INternet class A address of
44.131.159.228.

speak to your local co-ordinator for a copy. I'd send you mine but it would
be less than useless to you in the States.

>
> -be

One of the more serious problems with putting a packet repeater on a "voice"
channel is the noise you create in the speakers of listeners on a co-channel
neighbor (and I don't know about where you live, but where I live, there
isn't a local repeater channel where I don't hear from co-channel neighbors,
at least during morning band openings much of the year). It's incompatible
operation, and really liddy activity.

Source record: 38805

Hi Everyone,

Our group has just finished an EXTENSIVE evalaution of baycom modems manufactured by PacComm. I'm sure its new to many of you, that PacComm even makes a baycom type modem.

We found that the 25 pin PacComm unit ran circles around the Tiger unit. Hands down, no question about it.

The 9 pin PacComm unit was non functional tho. I can't believe this, but we had many stations doing the evaluation, with different computers/ radio combinations. None of them could make the 9 pin units go.

Has anyone had any luck with the PacComm 9 pin units ? I'd appreciate hearing from you either way regarding this matter.

PacComm bent over backwards to assist us and is reimbursing us for the 9 pin units, despite the fact that we had the units much longer than the offical 30 day money back grace period.

Comments, yah or Nay, thanks, Art, KY1K.

direct, please do not reply to the list !!!

Source record: 38807

Thw WETNET has established 4 packet only repeaters in the greater Seattle, Wa area. 1 is on 2 meters and the other 3 are on 440 Mhz. The entire ssytem works real well, as all the station then focus on the repeaters. The repeaters do bit regeneration and no voice can pass. These are not simplex digis but full blown repeaters. I have had file transmfer rates of 600 bytes per second. They are all doing TCP / IP, seem to work real well. All are within the normal voice frequencies and cause no bother to voice repeaters close by. Also all are at 9600 bps.

779. MFJ-1278B/Ten-Tec Omni V -> FSK problem!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-06 00:00:00 UTC
From: sassano@pcnet.com
Message-ID: <sassano-0502962337210001@ts3-pt13.pcnet.com>
Source record: 38809

My MFJ-1278B TNC has an 8 pin IDC connector that will allow me to hook up an FSK connection to my Ten-Tec Omni V. (one pin ground, one pin FSK). I normally hook up the TNC/HF rig using the AFSK mode with a cable (DIN 5 plug that allows me to hook up to the HF rig using the PTT, Audio IN and Audio OUT plugs on the back of the Ten-Tec....worked fine. When I plugged the FSK cable to the Mark-Space plug on the rear of the Ten-Tec (as per manual), I can not key the HF rig. (PTT, audio IN & audio OUT are being used). The RTTY plug on the Ten-Tec is to ground and I get key-down when I use it. Can I tap into the original PTT cable or am I missing something?

Thanks and 73

782. Meteosat/GOES reception

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-06 00:00:00 UTC
From: molivier@cs.esrin.esa.it
Message-ID: <4f75d7$7hf@news.esrin.esa.it>
Source record: 38812

Hi all,
I have a question about geosync wx satellite reception:

At the moment I use a wide FM receiver and a video converter to get pictures from Meteosat. The video converter is a piece of hardware that translates the audio signal from receiver's output onto gray levels for a picture to be stored on a RAM and displayed on a monitor.

I'd like to use my PC for the latter processing.

Is there a way of doing this? I have tried to plug the receiver's output into an MFJ1278 and display it as a WX fax, but that doesn't work, I can receive nice weather charts, but no Meteosat picture.

Would programs like JVFAX or WXMAN be of any help? Any other suggestions? I also have available a soundblaster and a KPC-3 TNC.

Thanks in anticipation for any assistance.

Hi David...

> does anyone have any 7910 or 7911 modem chips for sale. Either the AMD or
> SGS Thompson variety?

I have one brand new AM 7911 DC chip which I would willingly donate to help a good cause. If you consider that you are one <G>, then send me a stamped addressed envelope (see my web site) and I will send it back by return post.

BTW, I also have a built-up modem from a Wireless World design which uses, I think, a 7910 chip. It is built on their approved PCB and cased with a 240v PSU. It worked when I last used it some years ago. If that is of any interest I am open to offers.

>Bob NO6B

Bob,

That is a little extreme, although a popular route to take in some coastal states like CA and NY. I can not tell you how annoying it is to travel to California and find so many closed repeaters and closed autopatches. I, for one, would not continue to support the Arizona Repeater Association, if they closed their repeaters or autopatches.

The ARA has about 1100 dues paying members, and all our repeaters and FIVE autopatches in central Arizona are open to ALL licensed amateurs. Please feel free to use them when you are visiting Phoenix. BTW it's gonna be 80 degrees and sunny here today! I hope all you people in the rest of the US are enjoying your snow and record cold temperatures!

Also, please feel free to use the ThunderBird ARC repeater when in NW Phoenix on 145.43 (-) (no pl). :) We need a better antenna, so it's range is limited, for now. For those of you who are familiar with the area, this repeater is located on Phoenix General Hospital, I-17 and Beardsley Rd.

Using a voice frequency repeater for packet radio as a digi is NOT so
uncommon. Throughout the Australian "Outback" if and when there are no
other means, a few guys use these voice repeaters as digi's by consent
with other operators, usually very late at night or early morning.

It's also a common practice in certain places in New Zealand, when
(AND IF!) there are no digi's in a particular area, the blokes have
the consent of the local voice operators to use voice repeaters for
digi's with the same time constraints as in the Australian case.

Packet Radio: Amateur radio for hams that can read and write...

Kindest regards,
Bob, VK7KOB, ZL3TJP

HOOKUP FOR RADIO SHACK HTX-202 TO MFJ TNCS

This document is for customers of MFJ who are having problems getting their system connected and operational.

1. MFJ-1270/1271 tnc with no internal network:
All the components must be assembled into the hookup cable between the tnc and radio. The HT requires a mono plug on both of its' jacks, however, a few people have reported that their HT would operate with a stereo plug. There may be two hookups over the years that the radio has been out. The MFJ hookup cable will not work with the 1270 and 1271 because the connection network is missing from inside the tnc. Locate the two parts of the cable and note which color wire goes to which part of each plug. There should be a cable for the radio with 2 plugs on it, and a 5 pin DIN plug for the tnc, both with a loose cable attached, to be spliced together. First, on the tnc cable, locate pin 4 on the DIN connector. The MFJ color is yellow for the receive audio line. It should be connected to the tip of the large radio plug. Also connect pin 2 of the tnc to the ground sleeve. The ground usually is common to the dual ht connector, but you may want to split it for separate ht plugs. Next, for the transmit plug, connect a 2.2k resistor to pin 3 of the tnc, and a .01 capacitor to pin 1 of the tnc. Connect the capacitor and resistor together on the radio side, and connect it to the tip of the small radio connector. Connect the ground to the sleeve of the small plug.

2. MFJ-1270B/1274:
This model is much easier to connect, since it has the RC network built into it. Connect pin 1 of the tnc to the tip of the small plug, and pin 2 of the tnc to the sleeve. Connect pin 4 of the tnc to the tip of the large plug on the radio. Only three wires are needed for the hookup - transmit, receive, and ground. Inside the tnc next to the radio jack is R107. You will need to change it to a 2.2k ohm value. The original value was 47k, and later it was 4.7k. Next, locate a small white rectangle off of one end of R107. The two solder pads inside the rectangle make up jmp K and need to be soldered together, or connected in some other fashion. This ties the PTT and mic audio together(AC and DC).

3. MFJ-1270C/1276/1278/1278B:
These models have the same cable hookup as the 1270B/1274. The internal components have different locations and numbers on the resistor. All of these use jumper L instead of jumper K. The 1278/1278B uses both jumper K and L, depending on the radio port used. More information on locations are in the chapter on radio hookup,

page 21 in the 1270C/1276, and chapter 3 in the 1278/1278B manuals.

Special Note:
In many cases this arrangement will work just fine. Through feedback from customers, the value of the resistor can be of a different value from radio to radio. The values seem to be from about 500 ohms to around 5000 ohms. I recommend using a 5000 ohm potentiometer for the initial installation, an adjust it for the best performance. When the value is too low, the radio will key all the time, and when too high, it won't key at all. A balance point is somewhere between. Remove the pot and measure it, and replace it with the closest standard value for permanent operation.

AA5MT

1 TX audio--------- .01 microfarad----------small tip
4 RX audio----------Large tip
2 Ground----------both sleeves
5 Squelch --not used
3 PTT----------2.2k ohm----------small tip

I have my doubts about the uniqueness of the pattern generated by
same-type transmitters... and the stability of the pattern as a
function of temperature, time etc.
But it seems another sub-thread starts to discuss this.

A repeater is a repeater, whether it carries voice or data, and
must operate in the repeater segments of the bands. SERA
coordinates
all pairs in the repeater segments impartially. Simplex packet
is
a thornier problem. That usage takes place in what has
traditionally
been uncoordinated spectrum. SERA has opted to work with State
packet
organizations to deal with this. Each State's packet group is
allowed
to act as coordinator for simplex packet.

I disagree....if a duplex packet digi is set up ONLY to pass data
and NOT voice, it is a digi-peater and can operate ANYWHERE in
the band it wants to...just like a simplex digi....NOW if it is
an analog rptr that passes ANYTHING, then it must remain in the
repeater subbands....but to pass ONLY AX.25 packets, it is free
to go anywhere it wishes

There are two more programs that I am aware of.
The first was published in 73 magazine with source it is called ROBOCOPY.
This one is a copy/read only program with source in "C".

I have also used a program called CW version 1.04 based on the robocopy
program. This one was written by W0NFU, has no source code with it, runs
on an IBM PC.
Both of these programs require a seperate interface to your HF rig.

Sure, get a DB-9 connector, a DB-25 connector, some wire, a soldering
iron, and solder. Your KPC-3 manual shows you which pins connect to
which signals. Or if you don't know which end of a soldering iron
gets hot, just pickup a DB-25 to DB-9 adapter at any computer store.

From: jon@g7jjf.DEmon.co.UK
Message-ID: <1322@g7jjf.demon.co.uk>
Source record: 38701

Hi All,

I would just like to announce that I have set up a small Home Page on the WWW to act as a support site for my range of Shareware Packet Radio TNC Driver Software.

I have written three programs which run under DOS on IBM-PC Compatible computers.

The programs shares a common feature set and user interface but offer extra facilities specific to the configuration it is running on. These include integrated Personal Mail System with FBB compatible compressed forwarding, split screen or full screen display, 500 line scroll back buffer with search facilities, pop up menu driven YAPP and ASCII file transfer facilities, connect directory, directory browser with comprehensive file viewer, file and notepad editor, clipboard editor with associated functions, UUencode and UUdecode of files, 7PLUS encoding and decoding of files, REQDIR and REQFIL facilities with automatic uuencoding or 7PLUS encoding of binary REQFIL requests, simple to use yet sophisticated script language for automatic operation, timed execution of script files, a screen blanker, FBB header broadcast support plus many more.

The three versions are :

TNCV142 for use with a standard TNC

MUBAY102 for use with a Baycom modem or KISS mode TNC

MUTNC205 for use with the BPQ software

To hopefully encourage you to access the site and download the software, I am running a weekly Free Prize Draw offering a Free registration to any of the above programs to the lucky winner.

The URL for the site is :

http://ourworld.compuserve.com/homepages/jwelch

Please drop by and take a look.

Bye for now,

Jon.

vk7kob@canberra.dialix.oz.au writes:
>Using a voice frequency repeater for packet radio as a digi is NOT so uncommon.

In common usage among most packet people, a 'digi' is a device that stores one or more packets and then retransmits them as soon as the channel is clear, without hop-to-hop acknowledgements. The retransmission is NOT simultaneous as it is in a voice repeater.

In other words, a 'digi' or 'digipeater' is NOT the same as a 'digital repeater' might be.

Yes, it's confusing.

Which one of these did VK7KOB mean?

>Peace+
>Dan Reynolds, bcdlr@midwest.net, KB9JLO
>

Yes for shure! Try PACKY for windows or packtwin ... you can find it at
ftp.ibp.fr/pub6/pc/win3/misc/

For shure, you should try to find those 2 softs with Warchie in a ftp near your home
there are the names again packy.. .zip and pktwin.. . zip (where .. are N°
of versions ...)
(Try REGEX option or substring)

Those 2 softs are really good. support them (shareware..) by paying fees

What a mean spirited answer. There are lots of Hams out there who are
willing to write software and in the spirit of Ham radio are willing to
give it away for nothing. Ka9q NOS is one example where lots of people
spend many hours and still do as we speak. The Linux operating system
and software is another.
I think Stan KF0IA just flames for the hell of it. Had a bad day Stan ?

Look in ftp.ucsd.edu\hamradio\packet

Good advice, that. If you find the manual to be a problem, you might
also check out the web page of Gloria Medcalf. Someone said he thought
she was a Kantronics employee, per another posting.

She offers tons of radio/TNC hookup information. She is plugging a
book titled "What is your TNC doing?". Anyway, you don't have to
buy the book to see some pretty in-depth information. Here is the URL:

http://www.idir.net/~medcalf/ztx/tnc-bk/index.html

Check it out....

I didn't know I was asking for so much. As I responed to this
gentleman, I built my computer, (and business I have done from my home
has paid for it, not general family operating funds), my antenna was
given to me as well as my coax. The HT I am using was bought used for
me by my Dad, and the TNC I am using was a great used deal. I thought
hamming was about being creative in your building/acquiring. I didn't
know you had to go out and buy the newest and the best.
As a parting comment, some of the best applications I use are freeware
or public domain. Most of those programs were a labor of love....

>retransmission is NOT simultaneous as it is in a voice repeater.

In addition, one has to consider:
(a) the implications this would have on the collision domain of the frame; and
(b) the impact of the filtering, phase 'mangling', etc. of the repeater's audio
train on the frame - as Brian pointed out, the digital information is not
recovered and then re-encoded on a voice repeater -- it is shipped 'straight through'.

Please help a poor slob who can not seem to get his 1278B MFJ/version 3.1/ working with his Kenwood HF rig !
It locks into a signal on the unit, but I am not getting information to the screen. All 60 of my files are in the Multicom directory but I must be missing a step to get it all to talk to the IBM clone.
I even dropped out of Win 95 to DOS, also went to Safe Mode - all to no difference.
If anyone can either email or leave day tel number, I would appreciate it. Also, if there is either a checkilst or a BBS I should use to get things running, I will follow that path.
Sorry to sound so dumb, but there is a lot of information in their books without much "plug A into B" stuff.

Rick / N8HUJ at (804) 984-4255 daytime.

>(TCAPS)

You're simply wrong.

97.3(36) "Repeater. An amateur station that simultaneously retransmits
the transmission of another amateur station on a different channel
or channels."

Whether the repeater repeats voice or data signals is irrelevant. The
definition only specifies that the station *simultaneously* retransmits
signals of other stations.

The FCC doesn't recognize the term "digipeater". Rather they call
it a "message forwarding station", 97.3(28). Its action is considered
a special form of *third party traffic*. And that's what a conventional
digipeater is. It receives a complete message, a packet frame, checks
it for accuracy, checks to see if the frame is intended for it to handle
(otherwise it discards the frame without forwarding it), modifies the
header (sets the digipeat bit), and routes it to some specified station
according to a routing algorithm or according to direct source routing

in the header.

It does not automatically *simultaneously* retransmit signals of other stations. It *stores* messages from other stations, and *forwards* them to other specified stations after a series of checks and modifications to the header. Store and forward messaging systems are allowed to operate under automatic control under certain restrictions, but that alone doesn't make them repeaters.

97.109(e) "No station may be automatically controlled while transmitting third-party communications, except a station participating as a forwarding station in a message forwarding system."

But a digital repeater *is* a repeater because it automatically *simulaneously* retransmits the transmissions of other stations on another channel or channels, IE it doesn't modify the 1s and 0s of another station, it only passes them through, regenerated or not, as it received them, and *as* it receives them. The FCC has ruled on this, SERA has a copy of the letter, digital repeaters are repeaters in the FCC's view, and must adhere to the repeater subbands.

Of course you *could* interpose a TNC in the data path, store each frame as received, and then retransmit it on another channel, but that would just be a particularly ugly case of split frequency operation, and not at all what we mean as a digital repeater.

Gary

Bob,

This is not so uncommon in the remote parts of the U.S. either.

It is quite common for people here in Arizona to use voice repeaters
for sending packet info, especially when there is no other way. As in
the cases you sited, this is usually done early in the morning.

Also, the Metro Phoenix Area, the seventh largest metropolis in the
U.S. (most people don't realize how big Phoenix is), we have several
voice repeaters set up for "digital modes only." Two of them are in
the two meter spectrum.

Ian Wade's "NosIntro. tcp/ip over Packet Radio" is available for $23
plus shipping from both ARRL and TAPR. It is written around the
PA0GRI version of NOS, but that is pretty close to JNOS. TAPR will be
coming out with a JNOS book soon.

Bob

: Can anyone tell me what's new in the TAPR TNC-2 1.1.9 ROM version
: compare to the 1.1.8(a)? Does it come with Mailbox support etc?

No on the Mailbox. Follows the 1.1.9 rev notes

TAPR TNC-2 Release 1.1.9 Notes

(c) 1994 InfoMotion, Inc. All rights reserved. Permission granted to
TAPR, its TNC-2 OEM licensees, InfoMotion licensees, and all licensed
radio amateurs, to reproduce the contents herein, provided this notice
and the contents of this document are reproduced intact.

General:

The checksum for TAPR release 1.1.9 containing the KISS module is $2D.
InfoMotion licensees will not receive the KISS module; the checksum
will therefore be some value other than $2D.

Release 1.1.9 incorporates these new features:

o - CW identification in FSK using the onboard packet modem
o - Enhanced monitor mode filtering
o - Support for Dallas Semiconductor "Smartwatch" (tm) socket
o - NMEA beaconing mode
o - Modified P-Persistence

And these changes:

o - The pound sign ASCII character "#" is allowed in callsigns
o - The "OUT" command installed in version 1.1.8 was removed
o - In addition to identification at 9.5 minute intervals, The HID
function transmits an identification packet upon incoming connect
acknowledge, outgoing connect attempt success, disconnection, and
cancellation of outgoing connect attempts.
o - DWAIT is now applied to digipeated and non-digipeated packets
o - Delay equivalent to the current DCD backoff time is applied
after transmit release to prevent multiple transmissions with
extremely small delays in between

Corrections, bug reports, enhancement requests and the like should be
directed by mail to:

InfoMotion, Inc.
425 Seagrass Avenue
Sebastian, Florida 32958
USA

Internet: n2wx@tapr.org
Compuserve:75006.702

Specifics

CW Ider

Commands:
CWId {ON/OFF} default: OFF

FSK cw identification is now available. When CWID is ON, the string in the IDTEXT parameter is send at 20 WPM in international morse code at the times described for the HID command. If text is not present in the IDTEXT parameter, no code will be sent. The feature will not send correct code if the on-board NRZ->NRZI converter is bypassed.

When using the CW IDer, the HID function (HDLC identification) must be set to OFF or CW identifier may not automatically be transmitted at the 9 1/2 minute interval. A CW ID also occurs on connection activation, outgiong connect attempt success, upon a complete disconnect or when the disconnect is forced.

Because current regulations do not require a morse identifier within the United States, users are requested to leave CWID set to the defaulted OFF position lest they burden the channel with unecessary identification.

Monitor filtering

MNONPrin {ON/OFF} default: ON

The TNC will examine the contents of each monitored packet for nonprinting ASCII characters and discard the entire packet if at least one is detected. Nonprinting characters means any ASCII character less than the space character except for BELL, LF, and CR, and the DEL character. The test occurs after masking off the high order bit.

By setting MNONPRIN to OFF, and in concert with MNONAX25 OFF, the TNC will filter nearly all screen-garbage inducing monitored packets.

NMEA beacon function

TNC-2 now incorporates a dedicated mode enabling the broadcast of one or two NMEA version 2.00 (and compatible) sentences to the UNPROTO address. When placed in NMEA mode with a non-zero value in the NMEABCN parameter, the TNC broadcasts the most recently received sentences received from the attached NMEA talker on the radio link. No other outgoing transmissions are permitted with the exception of identification, beacon, CTEXT, and mailbox data (*if supported).

NMEA devices provide an ASCII output at 4800 baud, 8/N/1, consisting of one or more types of sentences containing various types of data. Most commonly these data contain navigation fixes. For example, the

author's global positioning system receiver (Garmin model GPS-55AVD) generates sentences containing the receiver's longitude and latitude (fix), time of the fix, groundspeed, waypoint data, and the like. An example:

$GPRMC,034523,Y,02754.31,N,08023.03,W,1.5,035,031294,4,W*23<cr><lf>

Meaning:
"$GPRMC" - Indicates the type of data (RMC-minimum recommended GPS sentence)

034523 - UTC hh/mm/ss
Y - data valid
02754.31,N - longitude
08023.03,W - latitude
1.5 - groundpseed
035 - Track made good over the ground (degrees true)
031294 - date ddmmyy
4,W - magnetic variation, West
23 - checksum (ignored by the TNC)

(Note that this example sentence was not actually generated by the unit and the checksum is probably wrong)

The TNC automatically ignores the linefeed character - it will not be broadcast.

Please note that the sentences are sent in the non-protocol mode, thus there is a distinct possiblity that the intended recipient may not receive the broadcast. Users desiring a gauranteed link should NOT use this new mode and should continue to utilize the TNC in connected mode.

** IMPORTANT **

TNC-2 firmware is provided "AS-IS" AND THE USER ASSUMES THE ENTIRE RISK OF UTILIZING THE FIRMWARE. TNC-2 FIRMWARE IS NOT INTENDED NOR IS IT PROVIDED FOR ANY PURPOSE, INCLUDING NAVIGATION, WHEN FAILURE OF THE FIRMWARE, OR HARDWARE, OR BOTH, MIGHT CAUSE BODILY INJURY OR LOSS OF PROPERTY.

NEW COMMANDS

NMeabcn 0..254 default: 0

The NMEABCN parameter defines the 10-second interval between broadcasts of the one or two most recently received NMEA sentences to the UNPROTO address =. If none of the selected sentences (see NMEAFLT1 and NMEAFLT2 for information regarding the selection) were received since the last power on, no broadcast is made. Normal TNC operation is enabled when the parameter is 0. NMEA mode is enabled when a non-zero value is present, and the TNC powers up in the selected CONMODE. CONMODE *must* be set to CONVERSE, SENDPAC to $0d,

and CR set ON (all defaults) for the NMEA parsing to work correctly.

NMEAFLT1 sssss default: empty
NMEAFLT2 sssss

The "sssss" is the 5 character NMEA preamble defining the device and sentence types. The parameter must be coded exclusive of the leading "$" character.

Ex: User desires to broadcast the GPS fix and UTC sentences produced by a GPS board
cmd:NMEAFLT1 GPGGA
NMEAFLT1 was
cmd:NMEAFLT2 GPZDA
NMEAFLT2 was
cmd:

Ex2: User now only wishes to broadcast wind vector data from a weather station
cmd:NMEAFLT1 WIMWV
NMEAFLT1 was GPGGA
cmd:NMEAFLT2 %
NMEAFLT2 was GPZDA
cmd:

NMEA NOTES:

o - To enable NMEA compatability, the TNC should be configured for 4800 baud, 8 bit, no parity operation.

o - NMEA defines a balanced RS-422 interface. A particular NMEA device may or may not function with the TNC-2's RS-232 interface. In the perfect world, everyone would attach the devices with an RS-422<>RS-232 converter, and the author recommends that one be used. THE USER THEREFORE ASSUMES THE ENTIRE RISK OF ATTACHING THE RS-422 NMEA DEVICE TO THE TNC-2 RS-232 PORT, including permanent damage to the NMEA device, or the TNC, or both.

Modified P-Persistance

P-persistance is a channel sharing technique that has gained great favor in the TCP/IP world. A modified form of P-persistance is now included in TAPR TNC-2 as an alternative to prioritized acknowledgements and DWAIT.

Modified P-persistance relies on two principles to achieve a more equitable sharing of the common frequency. First, when the TNC waits a random multiple of DWAIT after hearing another station before it transmits. The upper limit of the random value is user defined by the PERSIST parameter to prevent frequency monopolization by stations placing unusually heavy demands on the frequency, as with the case of a file transfer. Modified P-persistance increases the likelihood that

a station with higher priority traffic can acquire the channel.

The second way modified P-persistance promotes channel sharing is by gradually increasing the wait time when the TNC executes retry transmissions.

Modified P-persistance as implemented in TNC-2 differs from standard P-persistance in that acknowledged retries do not cause the time delays to cumulate. After a retry is successfully acknowledged the TNC reverts to the shorter delay that assumes a perfect channel. Another difference is that the retry delay is applied only to connections on stream A.

Modified P-persistance is selected by setting PPERSIST to ON and ACKPRIOR to OFF.

NEW COMMANDS:

PERSIST 0..254 default: 8

Defines the persistance, or delay, the station tolerates. The actual delay is a random period of time between one DWAIT period and PERSIST DWAIT periods. The default value is appropriate for keyboard users and most digipeater installations. Higher values around 16 or 24 are appropriate for file transfers.

PPERSIST ON/OFF default: OFF

PPERSIST ON enables the P-persistant function described above. ACKPRIOR must be turned off for this feature to function.

From: andy_w@sn4707.oldham.gpsemi.com
Message-ID: <4fcgji$qsg@nnews.Oldham.Gpsemi.Com>
Source record: 38723

Does anyone have any information on a couple of switched capacitor filter IC's the S3529 and S3528 which are made by a company called AMI. They are highpass and lowpass filter IC's. I'm really looking for data sheets and also for a distributor in Great Britain.

The chips are used in an audio filter designed by G3ISD which appeared in the BARTG magazine datacom in autumn 1989/ January 1990. I believe that a kit for the design was available at the time. Is it still available?

Any help would be appreciated.

I need the pin number layout for the Mac serial plug. I have the
pin-to-pin listing for making a cable to connect a PK-232 and Mac, and
know the pin arrangement for the DB-25, but not for the Mac serial plug.
It goes something like:

O O O

O O O

O O

Which is considered pin #1, #2, ...etc.?

849. IC-2000 microphone connector FAQ (here it is!)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-09 00:00:00 UTC
From: myers@West.Sun.COM
Message-ID: <4fg5f0$3r3@abyss.West.Sun.COM>
Source record: 38642
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

Here's a little contribution to those with IC-2000s. I've crossposted
to rec.radio.amateur.digital.misc for those wishing to connect a
1200 baud TNC to the IC-2000.

Please send me updates or corrections...

The IC-2000(H) microphone connector FAQ
Version 0.1 2/9/96
Maintained by Dana.Myers@West.Sun.Com

I found the following information in the IC-2000(H) service manual;
I haven't actually connected to this jack on my IC-2000H other than
the Icom microphone, so your mileage may vary.

Pins are numbered from left to right, viewing the front of the radio.

Pin
1 +8V from radio to microphone (low current capability)
2 Up/Down from mic to radio
3 Audio output from radio
4 PTT to radio (pull to ground to transmit)
5 Microphone return (grounded)
6 Microphone (input to radio)
7 Ground
8 Not connected

Notes:

* The +8V source looks like it is intended to run the DTMF encoder in
the standard Icom microphone. I wouldn't draw more than 10mA or
so from this pin.

* The up/down signal appears to be an analog input; the service manual
says "Up: 5.0V, Down: 0.0V, Off: 5.0V", but I believe this is an error;
I suspect it is more like 5.0V for up, 0V for down and 2.5V for off,
but I haven't measured it yet. Under no circumstances exceed 5V
on this line, since it is connected to the embedded microcomputer,
and make certain to include some series resistance, say 1k.

* The audio output is a fixed level, de-emphasized signal, it looks
like it will drive loads down to 600 ohms, though I'd suggest the
higher the impedance, the better. This should just connect directly
to the input of most 1200 baud TNCs for packet; it is not usable
for 9600 baud.

* The microphone impedance is specified at 600 ohms.

From: henson1@ix.netcom.com
Message-ID: <4ffttt6$bb5@ixnews4.ix.netcom.com>
Source record: 38643

I am trying to connect a BayPac Model BP-1 TNC to an HTX 202 radio using a hand mic cable. Has anyone done this? I would like to confirm the wire connections before I plug the darn thing into the computer.

This is a table to illistrate what I am trying to do:

TNC*	Function	Cable Wire
black	Ground	bare
Green	speaker	yellow
yellow	mic	red
red	PTT	(not used)

* the TNC is connected to the cable wire via a rj11 jack and wire

Thank you for your help!!!! and 73,

Doug Henson

Since the Motron TXiD system connects to discriminator output, it is
only sensitive to variations in carrier phase/frequency, and
insensitive to variations in amplitude.

>Gine Motron a call and they will send literature. I believe they sell a full
>manual for $10.00 which has both a good technology description as well as the
>usual "how to use theirs" stuff.

I had an excellent chat with Don Moser of Motron on this topic, and he mentioned his new web page: http://www.motron.com.

Bottom line is: not every radio is certain to have a unique ID, TXiD is a very powerful tool as part of evidence collection but can not be treated as infallible.

859. GTOR KAMsters: help us with thruput tests

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-09 00:00:00 UTC
From: kwick@mitre.org
Message-ID: <kwick-0902961856380001@wickwire1.mitre.org>
Source record: 38652

Fame, Fortune, Big Science: All Free!:

For some months we've been running tests of throughput
in the HF TOR and packet modes over NVIS links in New England.
(See the Packet Perspectives column in February's QST.)
The tests, which also measure other things, are
completely automatic (connect, login, file upload to KAM BBS,
logout, disconnect), so receiving operators don't have to do
any real work or even be at their terminals.

We have recently expanded these tests to long-haul links
(500-1000 miles), and want to do more of that while distributing
the load and getting more variety.

What we need:

Stations in the SE US (say between the lines from Boston to Texas
and Boston to Florida), anywhere from 300 to 1500 miles from Boston.
(We'll gladly try other links, but with our antennas pointing south
and SW, these are the best bet.)

The stations need to be equipped with Kantronics KAMs that can run GTOR.

They need to have antennas that have a reasonable chance of
communicating with New England (beams nice, but omnis work fine).

Freqs will probably be 30m, 20m, maybe 17m, during the day,
80m, maybe 40m, at night.

What you need to do:

1. Leave your rig on agreed-upon frequencies at agreed-upon times
2, Leave your KAM in TOR STANDBY, in BBS mode (if PC is off), with your
ARQBBS ON (for TOR measurements)
Or in command mode (for packet measurements)
3. Empty your PBBS when it's full (every coupla days, at most)

(Added bonus: you get to read fascinating, informative messages
over and over and over.)

If fame, fortune and hard science are your goals,
gimme (KB1JY) a shout at kwick@mitre.org
(Any pubs will mention you prominently.)

>2. Would I need anything more than radio, antenna, TNC , software and
>knowledge?

A license and a cooperating station on the other end are the only
other things you'd need. (Plus some prayers to the propagation gods
couldn't hurt.)

>3. What kind of bandwidth can I get out of HF packet?

Dreadful. The speed is limited to 300 baud, which is bad enough,
but because amateur packet doesn't use FEC, and HF is noisy, real
throughput can be measured with an hourglass.

>4. Would satellite UHF be a better option. The site is on the
>equator.

If you can afford it, Immarsat data terminals (2400 baud) are
available. Terminal prices approach $10,000, and connect time
charges are measured in dollars per minute.

OTOH, you could use amateur radio store and forward satellites.
It would be Email only, but fairly simple equipment can be used,
and there are no connect time charges. Speed is 9600 baud too.
As with all other amateur radio approaches, however, there are
content restrictions, IE no business communications, no dirty
words, etc.

It was an irrelevant, and perhaps irreverant, reply, but I think I
know where he is coming from. As a sometime software author myself,
I get irked by the attitude that hardware is worth paying for, but
that software should be free (or stolen).

It would appear that Ten-Tec intends you to use the RTTY jack on their
radio for PTT during RTTY operation, and use the Mark-Space jack for
modulation. Therefore, simply connect the TNC PTT out line to the
Ten-Tec RTTY jack when you want to operate RTTY. I'm sure this is explained
in the Ten-Tec manual under RTTY operation.

>point for information in this area? A website or mailing list
>perhaps? Please respond here or email me at hansen@ee.ucla.edu.

You might look at Bob Merrit's page, www.mindspring.com/~bobm.
Or you might want to experience 56 kb packet in action by looking
at Dale Heatherington's web page, www.wa4dsy.radio.org:80. One
of the links in the path to that page is carried over 56kb packet.
There's also a 28.8kb telco link in that path, so don't get too
depressed if it isn't as fast as you expect. Work is underway
to get the packet link connected directly to a T1 for net access,
but there's the little problem of a mountain in the way. :-)

Hello, Dan -

You could try UltraPak by G4WFT. One of the local users likes it.
It's designed to work best with F6FBB BBS software. The author asks
for 20 pounds registration fee (about 30+ dollars) which will remove
a 'registration window' on startup and entitle you to phone and email
support. And, of course, encourage him in future efforts. I don't
do windows so I haven't tried it, but took a quick look on a system
at the BBS QTH. It looked good, to a non-'point and click'er.

It's available at:

ftp.demon.co.uk /pub/ham/general
ftp.tapr.org /tapr/software_lib/terminal

as UPAK40.ZIP. You might also want to try UPAK401.ZIP, etc. for
updates.

I also read good things about WinPack v5.13 by Roger Barker which is
supposed to be freeware. It's available at:

ftp.funet.fi /pub/ham/packet/terminal

Have fun! 73 -

Hello Felix,

I suggest you use the original AFSK cable but do not connect to the
audio in on the Omni (you don't need it if you are using FSK).

I had to invert the 1278 mark space to make my setup work with the
Omni, but I haven't had any PTT problems. Good luck Dr. S. and let us
know what you found.

Code Practice with the KAM

You can use the KAM or KAM Plus to send code through a local repeater, listen to code with a speaker, and make code tapes. You can also practice sending code and have the KAM display the results on a computer. This article discusses KAM parameters, cables, and operations.

Article URL: http://www.idir.net/~medcalf/ztx/kamcode.html

From the home page at http://www.idir.net/~medcalf/ztx/ you can link to other articles mostly about digital modes. The articles may be reprinted in amateur radio club newsletters provided that credit is given to the author.

The site also contains diagrams for wiring radios to tncs.

Gary - you make a good point: the nominal impedance is probably high at
both the mic input and its' bridged accessory input; but in the Ten Tec
Omni's case here the accessory audion in jack is NOT used - FSK-in is
used and the problem remains @&*^$@&*^@ makes me so mad...

Check out a local computer store and pick up a serial cable
with a 9 pin female on one end and a 25 pin male on the
other. I have one that is only 12in long and is great for
portable operations. the pins should be connected properly.
Just make sure it's not a null-modem cable.

Do you still have a connection to the audio input on the acc connection ?
FSK generally does not connect with the audio inputs, there should be no
cause for the TNC to be introducing this distortion.

The +8 volts is to power the FET in the electret mic element.
Icom specs the *maximum* current to be drawn from this pin as 10mA.

>* The up/down signal appears to be an analog input; the service manual
>says "Up: 5.0V, Down: 0.0V, Off: 5.0V", but I believe this is an error;
>I suspect it is more like 5.0V for up, 0V for down and 2.5V for off,
>but I haven't measured it yet. Under no circumstances exceed 5V
>on this line, since it is connected to the embedded microcomputer,
>and make certain to include some series resistance, say 1k.

Yes, that's completely in error. The Icom "standard" for up/down
buttons is, the up button hard makes to ground to request an up step,
the down button makes to ground through a 470 ohm resistor to request
a down step. External voltage should *not* be applied to this pin at
all, the uP supplies the sense voltage.

Hi there. The last production run of the plastic variants of the venerable 3105
is at the end of April. The ceramic variants ended last October.
Buy 'em now while you can!

I was avoiding going into a lot of detail. Of course you are correct in that
the TxID-1 does not "read" any amplitude information, and is absolute by any
interpatation, but it is a GOOD tool to hope "prove" abuse by a given user.

Additional information like DF'ed location, attenuated readings (lots of
signal strength with attenuators in front of the guys house), recordings
(TxID-1) of the same trasnmitter when properly used (talking with ID/callsign)
are all inporatant pieces.

Also tools like APRS to let multiple stations plot a signal bearing and share
the data "quickley" over packet can also be of greate use.

The problems in Kansas are, sigh, not unique. I can tell you that the same or
similar problems exist in the Balt / Wash area as well. It is unfortunate
that we must spend time dealing with these issues, but they do keep coming
back.

We are also istalling seperate doppler type direction locators at all of our
recieve sites (12 +) and will be able to "localize" via the basic system
before real DF work with beams and similar comes into play.

>>>Look for one where you found your free computer, TNC, transceiver and antenna.

I dont get involved in these matters of controversy, generally, BUT:

I recently upgraded punchboxes here and wanted a full featured word processor. I had used Word Perfectx and Wordx. I called both outfits about latest versions, availability and pricing. Talk about sticker shock! Both outfits wanted 300 + dollars for their software!

I know it takes a LONG time and cost ALOT of $$ to develop these packages but one would think the price would come down, eventually.....

I began to wonder if I really needed either of them bad enough to pay that ammount of money. I eventually contacted both outfits and inquired if they sold their software based on useage-the idea being that an occasional dubber such as myself wouldn't be priced out if there was a reduced selling price based on ACTUAL USEAGE!

I edit a few misc files and write 15 or 20 business letters a year-$300 is just to much for me to justify. An unlimited/business user would probably find the price acceptable-they use it ALL THE TIME.

In the days of unathorized remote interrogation of your computer, it seems that verification of actual use of the software by remote/automation is possible. The install program could be a one shot only deal, then self destruct and the software could check the computer each time it starts to verify that it still resides on the originally specified computer. Or, maybe you pay in advance and when the agreed to number of uses has expired, so does your software! You get the idea!

And, Is this such a bad idea?

NO wonder people pirate software and/or look for freeware/shareware!!! (I don't condone pirating of software)....

The answer, for me, was PCx Writex, Advanced Level - a near equiv to Wordx Perfectx/Wordx, but priced at 45 dollars. When I called PC-Write, THE OWNER answered the phone, and we chattted for half an hour! I asked him how he could make any money selling an advanced application for so little $$. He told me he makes LOTS of money and that I didn't need to feel sorry for him!! The choice of which software vendor to give my $$ to was an easy one!

I suggest that everyone evaluates shareware or freeware or lower priced payware, it's out there, u just gotta find it. Competition-aint

it GRANDE!

Thanks and GL....Art, KY1K.

Well, I suppose the mic-preamp also gets power from the +8V, but there
is a DTMF encoder in the microphone, too. There's no spec in the
IC-2000 manual for maximum current drain.

>all, the uP supplies the sense voltage.

The up/down line is connected directly to an analog input on the uP,
and there is a 4.7k pull-up resistor; I don't think this will be
much use with a 470 ohm pull down. I tend to believe the voltage
is supplied by the microphone in this case, and I'll measure it
sometime and update the FAQ, unless someone meaures it first and
lets me know.

Thanks for the note, Gary!

I have done just that. I modified my PCS-4000 Azden and It works fine
that way.
Jnos doesn't know that there is only one radio. It's all the same to
it. You must turn the ONERADIO command in the TNC to ON so that both
channels won't try to transmit at the same time. The other problem of
course is that both 1200 and 9600 then are on the same frequency...
That's why I since bought a PCS-9600D for 440 9600 bds packet. But if
your local channel has a mixture of 1200 and 9600 users, Go ahead.

Personally, I think this would be a good idea, especially in areas that
are isolated from any packet radio links to the outside world, it could
help get packet radio going in some areas. However, I also understand the
arguments against it, ham radio is supposed to be an emergency service,
and depending on the internet to pass messages wouldn't be very helpful if
you lost your link to the internet is some kind of disisater.
But seeing how most Packet BBSes out there aren't really designed
to handle emergency situations, I don't really see this as a valid point.

If you are running Tnos under linux then the Tnos FAQ file will tell you
how to edit your inittab file to start Tnos at boot - and also if need be
get the kernel to ping tnos every 15 minutes to make sure it hasn't crashed.
If it has linux it will kill the tnos process and restart it !

If you have problems get yourself on the Tnos mailing list (agn see faq).

I don't know if this is possible, but I believe the Kenwood 733A has
separate outputs for 1200 and 9600 on the Packet connector. It might
be possible to use the same radio for 1200 baud 2meter and 9600 baud
440Mhz.

But again, I have never tried this, and probobly won't for a
while.....

This is exactly how it works, Dana. I have the schematics for all
the Icom mikes, and have repaired more than a few. Trust me, hard
to ground for UP, to ground through a 470 ohm resistor for DOWN.
No voltage is sourced on this line by the microphone. It should
be simple enough for you to test this. Short the pin to ground,
the radio steps UP, short the pin to ground via a 470 ohm resistor,
the radio steps DOWN. Apply external voltage to this pin at your
peril.

Well, if you already had a copy, you could get an upgrade version for
around $90 for either of these. The upgrades are quite extensive in
both of these cases. I wonder if WordPerfect will come out with a 32
bit version before Novell dumps it.

Back to the subject, there's a lot of good free or inexpensive
(shareware) software around for many ham applications. Just take a
look at ftp.ucsd.edu, for instance.

I am not.

The reason: using internet for message transfer has nothing to do with
amateur radio. Or should we rename out hobby to amateur communicators ?

The next step : let the radio amateurs use internet to connect to the local
(packet?) bbs.

The last step (from the government): sell the amateur bands to the highest
bidder.

Hello OM's

What is Winlink. I gather it is used for e-mail messages and can be
used for e-mail forwarding ?!?!?. Is this true or am I misguided.

I am looking for a mail package that I can simply attach export files
to e-mail and send them out automagically. What package can I use ??
Obviously I would import them also and forward them around to VK..

As technology moves forward, so should Amateur Radio. It is VERY unfortunate that the HF intercontinental links cannot support the megabytes of data generated every day by HAMS.

I have experienced first hand the delays of getting mail from Australia to the UK. I was lucky to get there within 7 days. Now, with internet forwarding, my mail is GUARANTEED to be there the next day. You can now have MEANINGFUL dialogue with international contacts.

I am actively participating in the internet forwarding scheme as it will, over time, replace the traditional links. No longer do a VERY small number of stations hold such great control over what is allowed and what isn't. It is probably due to that frustration that we all seek alternatives. No longer do you have to be nice to some of those arrogant stations as you know your mail will be received in it's intended destination within 24 hours...

I think we need to look at ourselves as communicators, not just radio operators. We are now able to use this new technology infrastructure, in the form of the internet, that Amateurs could never hope to setup themselves. For the cost of a local call we can ship mail all the way around the world. No longer do you have to "smoke up" your finals trying to push all this data down a 300baud hole.....

The internet is here to stay !!!

Cheers..Peter

Date: 1996-02-11 00:00:00 UTC
From: Jeff Hilton <notrf@mail.midusa.net>
Message-ID: <4flrno$93e@news.midusa.net>
Source record: 38688

My KPC-9612 won't send a signal on port 1 (port 2 isn't in use). It just sends a carrier signal, no packet info. It just started doing this recently.

Is my radio hooked up right? Is it the TNC?

Has anybody else out there had this problem.

Thanks

Jeff Hilton, notrf@midusa.net

:>lkenney@slip.net
:>San Francisco
:>
:>

This is one of the major problems with all of the autofrowarding systems - every regional clique has to "capture" the national WP server in their own area. When I ceased operation the National WP database was turned over to K1LT in the Columbus Ohio area (the area that I was leaving). K1LT is relatively centrally located and has connectivity via a hidden transmitter free high speed (> 9K6) network to stations on all of the major HF packet forwarding networks providing high efficiency updates and responses.

However, it now seems that regional groups on the west coast, Florida, New England and how many others I can't even determine have set up their own "supreme WP server" ... I'll bet the servers don't even bother to send updates any more.

In any case, my relocation was a blessing in disguise ... It forced me to pull the plug on operations and allowed me to see the political *BS* for what it really is. The new rules allowing unattended "semi-automatic" operation in any portion of the CW band, the notorious inability of amateurs to cooperate with each other, and the political *BS* have made a shambles of the system many of us worked so hard to build over nearly a decade.

Depends on whether you consider yourself to be a *radio* amateur or not.
Using non-amateur means to forward mail is OK to bypass a broken RF link
but should not be considered as a permanent replacement for that link.

Hi all,
I was looking at possibly getting an FX-146 for use with packet.
Since I don't require real frequency agility, just a few channels, this looks
to be a good kit. I do have the following questions:

- It says it's 9600 compatible; how well does it do?
- Easy to build/good instructions?

Anyone with any practical experience on this rig, please give me your
opinions.

Thanks and 73,
Russ KI7FL

Friend,

A fully functional standalone Broadcasting Radio Station Database for IBM and compatibles with more than 4,000 Radio Station records already. This program covers stations on Longwave, Mediumwave, and Shortwave. Each record contains the Station name, Frequencies, Schedule, Languages, Country, and Continent. The program sorts in same order.

What's needed to get it? Your EMail address and your Postal Mailing address for registration and future information via Post of other Radio Related Database programs. This information will be kept confidential.

If you can read a document written in MS Word(extension is DOC), request the operating instructions for the Radio Station Database Program called Voyageur. You'll get an idea from reading this document of the Voyageur Database and what it does.

Incidently, the program offered with this notice is valid until June 6, 1996.

Hope to hear from you..

Chuck

Hi ...

I would be VERY interested in any reports of the KAM+ locking up
when left unattended in the TOR mode. I had been running MSYS using TOR
with an upgraded KAM. About three times per week the KAM would be left
in a locked state. The red LED would be on continuously and nothing
short of a power down would restore it.

The KAM was HEAVILY used on a HF port here and trying to duplicate
the problem has been frutile. I have recorded the data to and from the
KAM before, during and after lockups and can not recreate the problem.

I have now reverted to Pactor as 99.9% of the users start in Pactor
and try GTOR only if the band is in GREAT shape. Left in Pactor, the TNC
is rock solid.

Leaving the TNC in GTOR is not an option. My users need the Pactor
as many are not running KAMs. (And most are hundreds of miles from a
phone line, hi hi.) Hence, trying to see if the problem is in GTOR is
not an option. I can only verify its occurs in TOR.

Being that I can record data to and from the KAM<>MSYS path ... and
being that I can not recreate the situtation by duplicating the data, I may
be wrestling with a lockup in the KAM firmware. The KAM is a upgraded
version running 7.1 ROMs. I tried another upgraded KAM but have no KAM+
to try.

Anyone see such lockups, please!!!, let the net know.

It is very unfortunate that the HF intercontinental links cannot
support megabytes of data each day, but be very clear that the
problem is not mostly technical. It is mostly a result of outdated
regulation, and some very poorly conceived protocols, and some even
worse implementations.

The system could work, but it doesn't work, and it won't work
as long as non-amateur alternatives are used. That's because
there will be no pressure to solve the HF forwarding problem
if the problem is sidestepped by non-amateur means. Thus, I
am opposed to internet forwarding of amateur data. Not because
it doesn't work, but because it works too well.

Gary

926. Landline BBS and Packet BBS Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-12 00:00:00 UTC
From: ag368@FreeNet.Carleton.CA
Message-ID: <DMo7y2.BHK@freenet.carleton.ca>
Source record: 38610

BACKGROUND - I am the SYSOP for the local Red Cross Emergency Services Committee. I am also their Communications and Transportation co-odinator. This is all volunteer as most of you know.

PROBLEM - I have a large area to cover. There is a mix of amateur and non-amateurs. I would like to know if there is a sofware package that will allow the system to send and receive landline BBS and packet BBS traffic. I am currently using the Phoenix BBS program from Genesys on a Zenith 286 with 2MB of ram and a 200MB harddrive. There are plently of slots left.

If I have to change the software what is the best brand to use for the configuration that I want to use? Also I haven't purchased a TNC or a dedicated radio yet.

I hope there is someone out there who has set something like this up and can help.

Does anyone know of a way to connect a packet station to the internet ?
I want to set up a base station , with a high speed packet station, and
have it be online. The end goal is to be able to look at my web page via
remote laptop computer. I'm not sure if it is even worth trying to use
conventional packet radio network protocols to do this.

I've been out of touch with the packet scene for 5 years now , and from
what I remember it was mostly a BBS style of communicating, with lots of
text and no images. With higher speeds (> 9600) content with images such
as WWW pages should be possible.

Who told you that HF Intercontinental links are the only solution
to your problem?

When there is a problem, work together to solve it. Using radio.
That is what the amateur radio hobby is about.

Look at satellite systems. There already exists a working mail
forwarding network via satellite, and the upcoming Phase-3D satellite
could extend this to real-time links (e.g. for conference server
connections).

Internet is nice to have, but it is *not* the solution to packet BBS
forwarding problems within the amateur radio hobby. Just as making
a telephone call is *not* the solution to solving the difficulty of
working a DX country.

INTRODUCING HAM RADIO ONLINE INTERACTIVE!
Now you can post free classified ads, DX openings, VHF band openings
and much more. And with over 10,000 readers stopping by last month,
your thoughts will actually get read at this ham radio web site! We are not
just pointers to cyberspace - we've got actual content - feature articles,
newsletters, product reviews, real-time propagation conditions and more.

The February 1996 edition of Ham Radio Online International Magazine
is available at http://www.accessone.com/~vbook/hronline.htm

Some of the NEW February stories include a review of SkyTel's "2-way paging" system,
radio surveillance frequencies, and the effects of two-way radio operation in blasting
zones.

Ham Radio Online has been selected as a featured web site by America Online
and a Top 100 web site for the month of January by Planet Earth, Inc.
New articles are available now and we add articles throughout the month.

Ham Radio Online has up-to-date news about Amateur Radio from around the world,
feature stories, real-time propagation and auroral condition reports, real-time
earthquake and severe weather conditions for emergency communications planning,
online humor section and the Ham Radio Online Library with fully indexed (find
any section with just a mouse click) Part 97 rules and regulations.

Plus we cover broadcasting, shortwave, scanning generally anything having to
do with radio telecommunications.

And we plan to offer some totally cool new services during the coming months. As
always its free and free of ads.

Thanks to you, we had over 10,000 readers stop by during January!

Please enjoy!

Rob

The beauty of internet forwarding is that anybody can do it. The
current forwarding paths are controlled by some people that like to
excercise their "given right"to kill mail..

If they were as "pure"as they would like us to believe, there would be
absolutely NO PROBLEMS !!!

Cheers..Peter

>I would be very interested in hearing comparisons between the HAL P38
>TNC and other TNCs. The P38 certainly seems like a reasonable deal
>for the price.
>
>My questions include:
>

>1) How is Clover II in weak signal conditions?

I have done several experiments over the last few months with
Ray Petit W7GHM on Clover and weak signal operations. It appears that
for weak signal work Clover is at least on par (and probably better) with
other digital modes. The through-put of Clover is very high. Measured
rates of 70 CPS in file transfer situations. This may be a little slower
on the P38 as it does not offer the Amplitude modes that are available
on the PCI4000 and DSP-4100.

>2) What kinds of connectors does the board need to your XCVR?

The interface on the P38 has three RCA style connectors
on the board edge. One for Transmit Audio, Receive Audio and PTT.
The PCI4000 and DSP-4100 are supplied with pre-wired cable.

>3) What software is available, and does it have auto-logging.
>

There are several programs currently available for the P38
cards. Express and XPPCI (the program that I write) both offer
autologging capability. Both programs also offer bi-directional
binary file transfer capabilities using Clover. Express is a
Windows based program and XPPCI is DOS based.

Hope this helps.

I do not have a passionate feeling about this, but I lean in the
direction that "it ain't radio" so it has no role in the amateur
radio network. I am afraid that the ease of mail forwarding via the
Internet will result in a complete dependecy on it rather than
RF links. I am also concerned about the huge volume of potential traffic
that Internet Gateways can admit to the radio network. The Internet
is a big pipe and a few subscriptions to listservers can create a large
amout of data flowing into our very small pipes. Its nice to be able
to excange a few messages with the other side, but I think the potential
problem outweigh the benifit. Just my thoughts - since you asked ;-)

Go out to the Oakland ftp mirror and snag a copy of JVFAX 7.0.(7.1 is out
on the net, but I do not know if it includes all the diagrams that are
with 7.0) There is a real simple uA741 opamp that feeds(and is powered
by) the asynch port. There is an "converter" that goes between you
vhf receiver and the opamp input. The converter is a vco that converts
the "am" wx sat pix into a "fm" hf type fax. The whole decoder setup
shouldn't cost more than $10(us) or so. The exar chip is the common
one used in most of the older packet only tncs.(I do not remember the
chip number off hand and I do not know of a source for it, I pulled the
demode chip from an older GLB PK1[i think the chip is an Exar 2201?]).
While you will be able to hear the NOAA birds (on 137.5 and 137.65{these
could be the wrong freqs if they are I will Email you the correct ones}
FM..it is a little confusing The signals are transmitted as an fm signal,
then you demode them into an AM fax signal and then convert them into
a FM signal(like HF wefax)) on your handheld or desktop scanner(if it will
tune to these freqs, most newer scanners will but some older ones have a
"hole" from 136 to 138)but you will need a wide band fm mode to even
start to get an image.
I reccomend that you get a copy of Dr Ralph Tagarts WX sat handbook(the
ARRL bookstore has it, check out their web site). While you will get a
"reasonalble" image with this minimum set up, with only slightly more
work you can get MUCH better images.
Good luck

> The reason: using internet for message transfer has nothing to do with
> amateur radio. Or should we rename out hobby to amateur communicators ?

Internet in addition to the current situation can be very usefull
since not every operator has a licence for HF. Therefore the
Internet can be his link over the horizon.

> The next step : let the radio amateurs use internet to connect to the local
> (packet?) bbs.

Personally I feel this as a very onlogical step since my opionion
is that most amateurs will use their set to connect to the internet
over packet radio. The prevent the casual netsurfer from initiating
a amateur radio transmitter some fancy firewalls can be used.

> The last step (from the government): sell the amateur bands to the highest
> bidder.

The is no commercial value in connecting to the Internet since the
number of radio amateurs is low compared to all the modem owners.
Ofcourse provides may loose some money since an amateur may decide
to use radio instead of modem, but I also think that a lot of ham's
will not even consider the Internet unless they can connect to it
over packet radio.

The internet basically runs on TCP/IP protocols, and so can packet
radio. On packet, we use some derivative of Phil Karn's NOS such as
JNOS or TNOS. These programs can deal with AX25 encapsulation of TCP/IP
and with ethernet, or slip, or ppp encapsulation of TCP/IP. So all you
need is to setup a box, hooked to the radio and having an ethernet, slip,
or ppp connection to the internet, which acts as a router or bridge between
packet radio and the wired internet.

>I've been out of touch with the packet scene for 5 years now , and from
>what I remember it was mostly a BBS style of communicating, with lots of

>as WWW pages should be possible.

Possible yes, pleasant no, at least until you get up to some real
speed. At 56kb it works well, but 9600 packet is slower than 9600
telco, and it *crawls* when presented with some of the pictures
from hell found on some webpages. (Even a 28.8kb telco modem crawls
with some of these pictures.) So if you limit the graphics to a
reasonable size, it's Ok, but text pages are still much more
snappy.

```
Your table shows the PTT as unused, which would allow it to receive or
monitor only.
The HTX-202, as with ICOM, combines the PTT and transmit audio on the
same line, i.e. the tip of the microphone plug connector. You combine
the audio and PTT from the modem into the connector with a 10K
resistor and a .1 ufd capacitor like so:
.1 uf
TX Aud (Yel) ---||-------------|
|---------------o tip of mic plug
PTT (red) --------\/\/\/-------|
10K resistor
Modem Ground-----------------------------------HTX202 ground

943. Re: re packet on voice repeaters

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-13 00:00:00 UTC
From: rayc@tcd.net
Message-ID: <N.021396.151539.38@tcd.net>
Source record: 38497

My 2 Bits... I have designed and builta repeater system that alowed sharing of one pair of freqs between voice and data. It was done on NTIA authorized freqs as a demonstration. (Fed Government Freqs). What was done was to simply tone protect voice and use data carrier detection on the data. I used KPC-2400's for the data and a modified GE Mastr-Pro repeater. (set up to repeat on carrier or tone and only regenerate the tone out if tone was detected on the input) The demo was rather dramatic and worked quite well. The voice users were totally unaware of the data that was being sent on the same system. Listening to the system "in the clear" was interesting. Data was sent at a leisurly rate until a voice conversation was intitiated. At that point the data of course halted and politely waited for an open spot... when that occured, between voice transmissions, the data packets were furiously exchanged! Worked quite well but was a political "flop" due to bias against "ham" technology.
It gave greater coverage and conserved both equipmnet and spectrum.

Remember Feb 20 is Green Key Night (& Day) - commemorate the beginning of
RTTY on the HF bands. Not a contest, no rules, no score, but
Use a mechanical teleprinter if you can
Use vacuum tube gear if you can
Use 850 Hz shift if you can
Wallow in nostalgia and above all have fun!

I'm considering buying either KAM+ or the latest PK-232.
Any comments pro or con? To keep the cost down, I'm not
considering the new DSP controllers. I just want a good,
dependable CW/RTTY/AMTOR unit.

73,
Ralph
WA9JST

Or, alternatively, you CAN, quite reliably, use 1200 baud Phase Shift Keying (PSK) TNC's on H.F. Radio. Many are operating on the amateur radio frequencies from about 14.105 to about 14.109 or thereabouts. They sound like a chainsaw when you hear 'em. Tuning, on your receiver, is fairly critical and may need some patience until the screen fills up with intelligible stuff remebering that the packet radio BBS's forwarding on those frequencies also compress their data to cut down transmission time. That will make the stuff look a bit unintelligible but much of it will NOT be compressed and after the patient tuning (depends on the quality of your receiver's tuning dial, as well, and the tuning resolution it offers) it will all come clear.

Try the G3RUH PSK modem kit and this will give 1200 baud on H.F.
There are a couple of commercial TNC manufacturers who offer 1200 baud PSK TNC's (Terminal Node Controllers). I have a Telereader Allmode Terminal Node Controller TNC-24 MkII which is popular but I know there are other commercial units. The TNC acts as an interface between your radio and the computer and decodes the packet radio information as it comes in off the radio into intelligent serial data which it feeds down (and takes data out of) your COM port on your computer.
Use a simple telephone modem program to send an receive this data but, better still, use a dedicated Packet Radio software program to get greater ease of use and more features specific to the utilities available with this mode......

Kindest regards,
Bob

>absolutely NO PROBLEMS !!!

Problems in mail forwarding and killing of messages should not be
solved by cutting around it, but by reviewing and discussing the
reasons for it.
Usually you will find that the content of the messages is not at all
relating to amateur radio, and is illegal to transfer in the country
where your intermediate system resides.

There is no such thing as a "right to send whatever you like via
the amateur BBS system". This should be understood by the users of
the system.

There is no need for every operator to have a link over the horizon.
Besides, every operator with a VHF/UHF license can operate on packet
satellites, and thus transfer messages all over the world.

>> The next step : let the radio amateurs use internet to connect to the local
>> (packet?) bbs.

>Personally I feel this as a very onlogical step since my opionion
>is that most amateurs will use their set to connect to the internet

>a amateur radio transmitter some fancy firewalls can be used.

Obviously you don't understand what was meant by the claim.
The reason why the next step is connecting to the BBS via Internet, is
the same as why people want to use Internet for forwarding: they believe
that the radio path is too slow/too crowded to be used for transferring
their messages, and thus they cut around it by using wire networks.

This bodes the end for "radio" as in "amateur radio".

>> The last step (from the government): sell the amateur bands to the highest
>> bidder.

>The is no commercial value in connecting to the Internet since the
>number of radio amateurs is low compared to all the modem owners.
>Ofcourse provides may loose some money since an amateur may decide
>to use radio instead of modem, but I also think that a lot of ham's
>will not even consider the Internet unless they can connect to it
>over packet radio.

Again, you have misunderstood.
The point is: as soon as no radio amateur uses radio anymore, because
the Internet is so much better, we don't need the spectrum allocation
and will lose the bands.

From: p.illmayer@sno.mts.dec.com
Message-ID: <4fr684$4fu@usenet.pa.dec.com>
Source record: 38506

I have started to forward approx 1mb of @ww mail into Australia per day. We have not received this type of mail for some months due to the poor hf conditions.

When I look at the contents of the mail, I do ask what value does all of this @ww mail provide. Some of the messages are quite stupid, in my opinion, but they have a right to be there as an Amateur did post it out. I think some of these chaps need a little educating and not post 70cm skeds to @ww !!!!!

I think it is for the USERS to decide if they want the mail and not myself as a SYSOP. The mail is NOT slanderous and does not contain obsceneties. If I have that approach, there is NO way in this lifetime that I could get 1MB per day via in intercontinental hf link.

One thing that it has done is to show the Sydney SYSOPS that we really can't cope with a 1200 baud backbone feeding 10 bbs's. I'm ALL for internet forwarding as it links Australia to the rest of the world. It provides reliable digital communications and you actually learn something by doing it !!!

Cheers..Peter

WA8DED's host mode firmware is available on the TAPR ftp site. The
"latest" is at least three years old, however.

955. re packet on voice repeaters

Newsgroup: rec.radio.amateur.digital.misc

Source record: 38509

Hi All!
In Brian Kantor's posting, he differentiates between a 'digi' and a 'digipeater'. Thanks, Brian, I had never thought there might be a difference between the two. In common usage, here in Australia, the word 'digi' is used as a contraction of the word 'digipeater' and, therefore, the words both mean the same thing(at least here and N.Z.).

I guess there must be some cultural/national differences between using the terms. Here in Australia (and New Zealand) the digi's are not similtaneous devices (usually!) and they accept a digital signal and send it out again once it has reassembled the packet/s but not whilst it is receiving the original packet/s. There are SOME plans around Australia for hill-top linear translators which do not re-assemble the packet but "translate" it to another frequency. My understanding is that these translators just heterodyne the incoming RF signal, whatever its content or protocol (TCP/IP or vanilla AX25) to another output frequency. I believe that the guys in VK1 (Australian Capital Territory or ACT) were toying with the idea because it was not conscious of the protocols it was sent and would retransmit all it was sent without change other than frequency. They, like myself. enjoy fiddlin' with TCP/IP a lot and they didn't have too much cash around to go building full scale mountain-top computer/TNC combinations which would handle multi protocol, multi speed (baud rates) for all the possible combinations of modes, protocols, and speeds that flash around the amateur radio spectrum in Canberra, the National Capital of Australia. It is my contention that something like a Kam Data Engine with it's ROMS blown with JNOS4.0 would do that trick just as well but, perhaps, not as cheaply. That will do multi protocols, AX25 vanilla packet AND TCP/IP and at a number of different baud rates on a number of different frequencies, depending on the configuration and the hardware hanging off it (radio's, any additional TNC's etc.).

Anyway, it was originally a topic about using voice repeaters for digital modes. I made a statement in my original posting that some voice repeaters here in the country areas in Australia and in New Zealand (my home country) are used, oftimes in the wee small hours, for BBS forwarding and file transfers between other areas where there is no reliable or available digipeater paths (refer to my note above for the definition). Like many countries, the major metropolitan centres, the cities etc., have good digital paths (mostly at 1200 baud though there are some 4800 and 9600 baud BBS and NOS forwarding paths but not, generally, for the actual users at their keyboards). The country areas, with a less well populated amateur fraternity, often make do with whatever is conveniently available and this can be, in a few areas in Australia, a voice repeater on 2 metres being used as a

digital mode path to another BBS or TCP/IP station.

Kindest regards,
Bob

I'm a newbie APRS type (just installed the shareware version) and haven't a clue as to which frequency in my area might yield some results. I'm located near San Luis Obispo, California.....so is there a common frequency that APRS traffic is passed on?

The blank map is getting terribly boring

Thanks,

Shawn WB6JWB

Does Kantronics no longer use them (in the KPC-3, KPC-9612 and possibly other models)? Unless Kantronics is re-designing, they are going to have a headache too.

However, the US Caller ID standard uses the same modem tones, so several new demodulator chips have been introduced for that purpose and could be adapted to packet. For example, the Motorola MC145447 receives as well or better than the 3105, and also doesn't require the receive bias adjustment. (The Kantronics TNCs use a preset compromise bias, which can cause bad performance if the 3105 is on an end of the bell curve).

Despite the best efforts of TI, the long-anticipated obsolescence of 1200 baud packet is unfortunately going to be delayed.

>Sorry, I'm sure you get this note once a month, but...
[...]
>Anyone know how to make a Realistic HTX-202 to TNC Cable?
[...]

The HTX 202 interface is compatible with most older Icom, Yaesu, or Standard HTs (essentially any brand other than Kenwood that has two plugs), so if you find a diagram or assembled cable for those it will work.

The PTT function is combined with the mirophone input on these radios. Drawing DC current out of the microphone jack will turn the transmitter on. The cable does this with a resistor/capacitor arrangement:

TNC: RADIO:

PTT --- R ------*------------ MIC TIP
|
AF OUT --- C ---

AF IN ----------------------- SPKR TIP

GND ------------------------ MIC SLEEVE
SPKR SLEEVE

Use two small-diameter shielded cables with the radio plugs simply connected directly to one end. Put the resistor and capacitor inside the plug shell on the TNC end. The resistor R is usually in the range of 2.2 K ohm to 4.7 K ohm. It doesn't need to be exact. Some radios won't key with the 4.7 K so I'd recommend using a 2.2. The capacitor couples the audio out of the TNC into the microphone input. A value of 0.1 uF (microfarad) usually works. As you can see from the diagram, the speaker output is simply connected directly to the AF input of the TNC. You can plug in only the speaker plug and the radio will not be able to transmit (this is useful for example to decode packet signals that may leak into a voice repeater, without sending any there yourself).

: Anybody have any idea?

RTFM. Basically the Unix equivalent of autoexec.bat is the scripts in
/etc/rc.d. Read the scripts and you'll see what they do. I don't know what
kind of output NOS creates, but you can always pipe it to /dev/null if
it's just occasional text messages (not heavy-duty fancy formatted text,
or menus that you need to interact with). So the command line in the
/etc/rc.d/rc.local for instance might be
jnos > /dev/null &
& means "run in the background and gimme the command prompt back".

But, how would that even be useful, to run it without seeing it show up on
one of the vc's? Isn't it true that you have to interact with the main
program to make connections and do other useful stuff?

I believe there is a way to make a program appear on a particular vc too,
instead of the default one. And I've yet to run out of vc's anyway; 10
is more than I can keep track of in my mind.

961. KAMPlus TNC Goes haywire!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-13 00:00:00 UTC
From: Marinus Willemstijn <willemma@telkom19.telkom.co.za>
Message-ID: <4fpbki$o48@newnews.iafrica.com>
Source record: 38631

Thanks for reading...

Can anyone please help with the following problem. I have a
KamPlus TNC which I bought secondhand. It works fine, but when
I switch it off and on again it goes in to some kind of mode
where it wont accept any commands from Winpack.

I then have to use a hard reset to reset the TNC and then
change all parameters again, etc, etc.

Its becoming quite a drag because I now have to leave it on
24hrs a day.

Is the internal battery maybe at fault - but why doesn't it
reset to defaults when switched on again?

Please help.

Source record: 38634

Hello, I'm new to the group so please forgive me if I'm posting "off base." I'm N0ZES but I'm asking this question on behalf of a friend who's going off on an "around the world" sailing trip. They'll have GPS and maritime radio and all those goodies, but they're asking me about having Internet access on the trip.

(They know I do TCP/IP via packet).

I told them that they can get licensed and do packet, but that most packet is VHF/UHF which is only to the horizon. I told them that they *can* do packet via HF, but the baud rates are low and the reliability even lower. Basically, I said to them that they need a 300-baud acoustic coupled modem and they dial in at ports of call. They'll do that (they'll be in ports where more advanced modems are virtually certain not to work!). Finally, I said the only solution that seemed viable to me was some sort of satellite based communications.

I'm *totally* ignorant of satellite communications, both ham and non-ham. I wonder if anyone in this group has any info on digital satellite TCP/IP, packet, or even satellite "cellular" (which would let them use a modem).

Any suggestions for my (much richer than me) friend?

Please reply by e-mail to mschwarz@winternet.com or n0zes@n0zes.ampr.org

Thanks and 73s!

I'm looking for anyone who has more information on the new WX alert System. It's a system that not only starts Weather Radio's (Like the ones at Radio Shack), but it transmits FSK signal with County, Weather Alert, Type of Alert, Duration, etc. information as well. If any one has any OFF THE SHELF PRODUCTS that I can use to decode this signal, let me know. What I want to do is to use this information to bring up a series of Repeaters Using DTMF signals, and then to play the WX Radio audio over the repeaters. So first I need to decode the FSK signal then sort the information as to County, etc. then to bring up the Repeater or Repeaters. I know I'm rambling but maybe you can read between the lines. I would need to have a FSK decoder (Modem) and a DTMF generator, plus maybe a microprocessor to make all this work. ANY IDEAS OR QUESTIONS PLEAS E-MAIL ME!!!!

9600 baud packet provides 500 bytes per second transfer rates (a 14.4kb
telco modem gives 1600). Hardware is available to go faster. Start

I use a program called Log-EQF it is written by a gentleman in PA. It is a excellant program, it will run on any dos based computer and runs fine under windows and windows 95. It works with all the computer based callbooks and has 2 user defined fields and a notepad for each contact. It works with most all computer controlled radios. It has a split screen packet window and also works with packet cluster software. It has several contests built into it and you can define your own if you like. It is a great program and the registration is only $30 and he is very helpful if you have any problems. It is on most of the shareware CD's like bucmaster and QRZ. You can contact him at 412-457-2584. Hope this helps. 73 de Dave KB8EAP.

Hi

My friend RUI, CT1EIF has a new TM-455E(Europe version).
He tried to connect his 9600 baud tnc to the rig, but without sucess.
Decoding data is 100% ok, but no data is sent out!
All cables, connectors and tnc are OK.
The radio is suposed to be "1200/9600 ready", but it just doesn't work!
It seem other guy's in Europe are complaining about the same problem.

Is it a E version problem???

Do you know why this happen???

Have you any solution???

And what about covering other freqs. Is it possible to "open" the rig's
range???

I'll apreciate very much your help.
Many thanks in advance.

975. One Radio with DR-610 and KPC-9612

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-14 00:00:00 UTC
From: Dan Lehnen <d-lehnen@ux1.cso.uiuc.edu>
Message-ID: <4frbbj$3lf@vixen.cso.uiuc.edu>
Source record: 38514

I have tried using the ONERADIO command with my kpc-9612 and my Alinco DR-610 with no luck. The Alinco will do 1200 or 9600, but not both at the same time. You Alinco DR-610 owners out there know you have to push the function key and hit the RC key for the "A" to flash right? Ok, when the A is flashing it will transmit and recieve 9600 fine, but nothing on 1200. The same if the A isn't flashing, 1200 fine and nothing 9600. I suspect it will do fine on other radios though. If anyone has gotten it to work on the DR-610 please let me know... These are my experiences with this combination of radio and tnc.

976. Re: JNOS lite ?

Newsgroup: rec.radio.amateur.digital.misc

Message-ID: <4frnkg$brt@news.halcyon.com>
Source record: 38515

You want to have a look for a 8088 compiled version. In the JNOS make file one has a choice of which processor to compile the nos for. The 8088 is one choice. Also there is a program called PKLITE which will compress the EXE file when the compile is finished, so it might run on your XT. I have seen 1.08 run on an XT.

Gary

[...]

Any radio which will operate at 9600 can also handle 1200 through its 9600 port. Forget about the microphone and speaker plugs (well, you could leave a microphone and/or speaker hooked up for occasional analog FM use) and connect either or both TNC ports to the radio's wideband audio port. Then leave the radio in "9600" mode for any digital operation.

To operate both modes at the same time, a parallel combiner from the TNC ports is required. The hookup for the receiver is easy. Just connect the discriminator output of the radio to both audio inputs on the TNC. Similarly, the PTT lines can be ORed together by just connecting them in parallel. The transmit audio is the only moderately complicated part. If the TNC mutes the signal out of the port which is not transmitting (I beleive the KPC9612 does), then a simple combiner ("T" network with the radio input in the center) of two resistors will work. You'll probably have to move the jumper inside the TNC to get line-level rather than microphone level audio out of the 1200 baud side to be compatible with the radio's input. Adjust the level controls inside the TNC for the proper deviation on each mode.

> Use a mechanical teleprinter if you can
> Use vacuum tube gear if you can

> Use 850 Hz shift if you can

I didn't think that much shift for low rate FSK signals was still legal in the US. Turns out it almost is (except for the pesky "excessive bandwidth is not good amateur practice" clause in 97.307(a)). But further contradiction is found in Part 97.307(f):

[for HF bands longer than 10 m]
| (3) Only a RTTY or data emission using a specified digital code listed
|in S 97.309(a) of this Part may be transmitted. The symbol rate must not
|exceed 300 bauds, or for frequency-shift keying, the frequency shift
|between mark and space must not exceed 1 kHz.
[for the 10m band]
| (4) Only a RTTY or data emission using a specified digital code listed
|in S 97.309(a) of this Part may be transmitted. The symbol rate must not
|exceed 1200 bauds. For frequency-shift keying, the frequency shift between
|mark and space must not exceed 1 kHz.

Notice the different wording of the two rules. (4) clearly indicates that a symbol rate of more than 1200 bauds is not allowed in the 10m band. However, (3) is worded with an "or" which sounds to me like a symbol rate of more than 300 bauds is legal if the frequency shift is less than 1 KHz (which would allow a symbol rate of nearly 2000 bauds).

Has this apparent mis-edit been addresed in a revision of the rules? I suspect (3) should be worded exactly like (4), to specify that the symbol rate is limited to 300 bauds in all cases.

Use the European version when you find it. Speculation has it that the US version has been doctored. Try a web search for PGP or RSA. If all fails mail the sci.crypt news group. If that fails mail me and I'll ftp you a copy with the windows frontend. I use it all the time for email.

What makes you think my description is in error, other than some other Icom radios are different? The mic jack audio out is derived from the top of the volume control, directly from the IF demodulator, as indicated by the schematic and block diagram. The block diagram indicates signal flow _to_ the volume control and mic jack (via a buffer amplifier), then it indicates signal flow _from_ the volume control to the speaker amplifier.

I believe my description is correct.

[The mic connector on the IC-2000 is an RJ (twisted pair/telco style) connector, I doubt that headset that plugs into the IC-735 would plug in ;-).]

thanks for the note!!

Dana

981. F.S. Toshiba Laptop T-1000 Great for Packet.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-14 00:00:00 UTC
From: mercury@metronet.com
Message-ID: <3122140F.1044@metronet.com>
Source record: 38520

Toshiba laptop T1000. This unit has a floppy disk and is in good
working condition. It works fine when hooked up to a TNC.

The original 1.8 amp nicads were replaced with 2.2 nicads about 2 years ago.
The operational time with the 1.8 nicads was around 4 hours. I would guess
the new opearional time with the 2.2 nicads would be between 6 and 7 hours.

Included are a carrying case and a portable fax/modem 96/24. The portable
fax/modem can operated via internal battery or wall power.

I used the laptop for packet when I was the District Communication Officer for the
L.A. County Races group. Otherwise the unit has not been used.

Looking for aroun $200 for the package. Would also consider some trading.

Stan: I too had an interest in the FSK transmission by the National Weather Service and attended a briefing here on the West coast to learn more. What transpired was that one and only one Canadian outfit was making decoders. You asked about off the shelf products and this manufacturer had a strangle hold on the product.
I asked for further information on the FSK scheme and was told that the information was proprietary! I simply can not conceive of a US government agency in which such information is not readily available and especially so from a non US manufacturer!-nothing wrong with Canada of course as it happens that they took the initiative!
That is as far as I have been able to go with this and I am still concerned that this inforamation is NOT public knowledge and available by many providers and home builders. Cliff Buttschardt W6HDO

The "No Pay" will happen with all reputable insurance carriers if:
1) The tower is not erected in compliance with the manufacturer's
drawings, or an alternate method designed and certified by a registered
structural engineer;
2) The tower is loaded beyond the published manufacturer's ratings or
alternate ratings certified by a registered structural engineer;
3) A retractable tower is not retracted during high winds (violates #2 above);
4) The total amount of damage claimed would normally require an "excess
coverage" rider, which is available specifically to cover high-risk or
high-value items such as collections of valuables, jewelry, radios, etc.

From the list of antennas you are looking to buy, that tower was
overloaded even in 50 mph winds, which is where TriEx used to rate their
retractable/collapsible tower structures. If you had a PE design or
load-rate your former tower and you did not exceed those ratings, your
claim for damages would be against that PE firm, not State Farm.

As a State Farm member (it's a MUTUAL company in Ohio) and a registered
PE, I agree that they should reject claims for the above reasons. If they
quoted you some other reason, call your family attorney. Your Mileage May
Vary.

CHRIS-
If the station is running as a "store and forward" digipeater I agree with
your interpretation. However, Gary is referring to real-time direct
rebroadcast, not store-and-forward.
There's a lot of confusion in terminology among people unfamiliar with FCC
R&R and/or packet technology (not you). However, this one is clearly
defined in the rules. A packet repeater (not S&F) MUST comply with the
same operating restrictions (97.205) as any other repeater, whether it
retransmits voice, ATV, RTTY, or any other authorized mode; Par 97.109 d
and e also covers RTTY and packet respectively, but clearly does NOT
supercede the requirements in 97.205.

Sorry Dana, but this is in error. There is a fixed-level audio output
pin in the ACCESSORY plug in the rear of many Icom radios (735, 740, and
751 rigs are my experience). The level is high enough to operate HF
digital operations with PK232s and KAMs (although it is not enough to
drive the PK232 from my 751 when the '232 is in Morse code - not that it
much of a concern for me. However, the audio output derived at ICOM
mike jacks is adjustable with the volume control. I can confirm this
because I have the Icom Boom/Headset mike and it works with my former
735, and currently owned 751, 706 and 2310 (UHF/VHF mobile). If however
it is the case for the IC-2000, it would seem that this is peculiar to

this radio.

(Finis!)

My apologies - I did not wish to discredit your schematic interpretation
abilities whatsoever. It struck me odd, however, that this rig would seemingly
have a different configuration from the rest of the Icom family of radios,
as I noted in my last comment of my original posting.

>The mic connector on the IC-2000 is an RJ (twisted pair/telco style)
>connector, I doubt that headset that plugs into the IC-735 would plug
>in ;-).

From your description, sounds like Icom used the RJ-45 connector,
which is used by the telephone industry, so I have been told, as a
"data jack". This is the type of jack that is also used on the 706. But

you are right, here I was with the Icom boom-headset with the radial 8 pin plug and in accordance with that Law of Physics that says you can't put a square peg in a round hole, it didn't fit. As well, the stock 706 does not come with a DTMF pad on the mike (when told by an Icom America rep that DTMF mikes were over $100 a pop and the inclusion of one would have thrown the target price for these radios out of whack, I didn't have the presence of mind to remind this individual is that what he was quoting was the retail price, not the actual value of manufacturing - which is probably in the order of 10 bucks - but I digress). So I had a couple of 8 pin radial jacks, and rooted around in the shack for a mini-DPDT switch and scrounged a curly cable with an RJ-45 plug on it, went to Radio Shack and bought a little perf board and one of their blue experiementer boxes. After careful wiring, and a lot of swearing and making sure I did not poke my eye out with the soldering iron and Voila! I now have a little adapter box, in which I can plug my boom headset and an Icom mike with DTMF pad and it is switchable. So far, it seems that the boom mike has better audio, according to the tests I have been doing so far. But when I want to make an autopatch, I just flip the switch and use the DTMF pad on the other hand mike.

So it is possible to use headset that was used on my 735, but a little adapter is necessary. (I understand that Icom has an adapter ready made, but I read somewhere it is $US45, which would put it at the $CAN65 range. It wasn't worth it.)

73 and live better digitally
Jim, VE3XJ

Yes, I faced the same problem with my 706, coupled with the fact that the 706 stock mike does not have a touch tone pad
thanks for the note!!

989. PMP & EZPacket Software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-14 00:00:00 UTC
From: middleto@mdd.comm.mot.com
Message-ID: <middleto-1402960923250001@mac_dm2.mdd.comm.mot.com>
Source record: 38528

I am looking for a newer version of the shareware package Poor Man's Packet (PMP) beyond v1.1 published in 1991.

Alternatively, I have read on the WWW that there is a simila software package called EZPacket which also works with PMP class modems.

If anyone has paths on the net where to obtain copies, please let me know. Alternatively, I can receive attachments at my address middleto@mdd.comm.mot.com if you have something kicking around in your personal file system.

73 and Thanks,
Don Middleton VE7IMD

>They sound like a chainsaw when you hear 'em.

Thanks for the reminder that the 300 baud limitation is a USA-centric
artifact of our antiquated rules. Higher speeds may indeed be available
to amateurs in other countries.

However, HF packet is bad enough at 300 baud. At 1200 baud, selective
fading will trash the symbols on all but the best and most stable
paths. Baud over about 50 are difficult to use reliably on a fading
channel without heavy FEC. To achieve better throughput, symbol
overloading schemes like Clover are a better choice (basic baud 31.25
with symbol overloading to 375 bps, *and* strong FEC). Unfortunately,
encapsulating TCP/IP frames in Clover is not an off-the-shelf solution.
I expect you'd want to run a PPP link over Clover (Clover appears from
the outside to be quasi-duplex), but you'll need to do the connection
setup manually, and talk directly to the P-38 API via your own driver
code. That's not difficult, in fact almost trivial if you're running
Linux.

>this combination of radio and tnc.

Just put it in 9600 mode and wire both TNC ports to the 9600 port
on the radio. AF out can be bridged, PTT wire ORed, and Tx audios
combined through a pair of 620 ohm resistors.

You'll be doing 1200 baud with "flat" tones rather than with the
normal twist, but that's usually not a problem. (The old TNC2
had backward twist and it still worked.) But if you want to fix
the twist, you can put RC equalizing networks in the 1200 baud
lines to and from the TNC.

Marinus,

Check that your s/w is not leaving the unit in hostmode when
you exit. Some s/w such as Kagold can use hostmode but some
cannot and will lock up the TNC.

Is this a new unit? Maybe the transmit audio level is too low to
deviate your radio. There is a jumper clip and potentiometer to set
the level that might need adjustment.

Have you checked here: http://www.idir.net/~medcalf/ztx/wire/index.html
for the correct interconnection for your radio?

No, I haven't had this problem with mine.

I recommend you try WNOS, available at:
FTP.UCSD.EDU/HAMRADIO/PACKET/TCPIP/WNOS
I use it here on a 286 with one floppy and it runs great.
It runs in a lot less memory than JNOS.
Your other choice is to buy the Borland C compiler and recompile JNOS with the minimum stuff you require.
BTW. Wnos will compile with TC++3.0 (only $89.00)

Good luck

They do here in the US too. The real distinction is between digipeater
(or digi) and digital repeater. A digital repeater isn't store and
forward, but a digi (digipeater) is. Note, our government doesn't recognize
the terms digi or digipeater, they are amateur slang. Our FCC calls
such operations digital store and forward stations. And the FCC calls
digital repeaters simply repeaters, and treats them like any other
repeater for the purpose of regulation.

Toshiba laptop T1000. This unit has a floppy disk and is in good
working condition. It works fine when hooked up to a TNC.

The original 1.8 amp nicads were replaced with 2.2 nicads about 2 years ago.
The operational time with the 1.8 nicads was around 4 hours. I would guess
the new opearional time with the 2.2 nicads would be between 6 and 7 hours.

Included are a carrying case and a portable fax/modem 96/24. The portable
fax/modem can operated via internal battery or wall power.

I used the laptop for packet when I was the District Communication Officer for the
L.A. County Races group. Otherwise the unit has not been used.

Looking for aroun $200 for the package. Would also consider some trading.

> It seem other guy's in Europe are complaining about the same problem.

I have done some testing with a TM455 and 9k6 packet. My conclusion is
that it works perfect. Treu FM (no PLL modulation) and fast turnaround
times.

What do you mean by "no data is send out" ? Does the transmitter not key
up at all, or is there no modulation on the carrier ?

Kenwood has a strange way of naming the pins on the data connector.
PKS (packet standby) means PTT for example. Are you sure the cable is correct?

TNC Packet Access Agreement

This following Rules and Regulations must be agreed to before access to the TNC Door will be granted. You will be required to send a copy of this Agreement - as well as a copy of your Ham License - to ATD BBS. This may outwardly seem unreasonable, but there are legal ramifications involved, and I'd rather not have to respond to any FCC complaints that have my name on them <grin>. Here we go:

1. You agree to follow all Part 97 regulations.

2. You agree to relinquish the TNC whenever requested by the Sysop.

3. You agree to report any and all abnormalities while using the TNC - a Message to the SYSOP will suffice.

4. You agree NOT to change your Callsign - using TNC commands - while using the TNC Door.

5. You agree to adhere to any rule changes made in the future concerning the operation of the TNC Door on ATD BBS. I promise to announce any changes that affect operation of the TNC Door as soon as possible, via either the [N]ewsletter or via private EMail to you.

If you agree to the above, then print out this entire textfile, sign below, and and return with a copy of your Amateur Radio License. You will then be granted Amateur Radio Operator (HAM) access.

This question was posed to me by one of our local Red Cross folks...

Instead of using a BBS, have you considered setting up an Email mailing
list instead? Of all your people that would call the BBS, how many
already have an Email address on some service somewhere? I'll bet your
friendly neighborhood ISP would set it up for free and then you have NO
box to maintain and no users to train (or contend for the one or two
modems you might have). If there is an Internet connected packet gateway
(xNOS, etc) in the area, the hams could pick up mail there via packet.

Even if you had to manage the list manually using an alias or .forward
file, it seems a whole lot easier than taking care of a box. FWIW

>1) How is Clover II in weak signal conditions?
>2) What kinds of connectors does the board need to your XCVR?
>3) What software is available, and does it have auto-logging?

Roger,

One clarification: the HAL P38 isn't a TNC, since it doesn't do packet. But it does support RTTY, ASCII, AMTOR, Pactor, and Clover. I've found it to work quite well, and my experience with Clover has been quite positive. I've seen extremely good throughput even in very poor conditions. The P38 uses RCA phono jacks for connection to your rig, and is easy to wire up and get running. You need a 16 bit slot in a 286 or higher PC compatible computer.
As far as software goes, there are Windows programs available (Express and Ragchew) and at least Express offers logging. On the DOS side, I know of several, including the P38 software that comes with the board (no logging), and XPPCI from KF7XP which does handle logging. For RTTY contesters, WF1B's RTTY contesting program supports the P38.
Hope this helps some. 73,
Doug Hall, KF4KL

Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October 1994 to add the discussion of non-Usenet mailing lists and streamline most of the history discussion, and to change the moderator information for rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

PKlite will do nothing for your memory problem. It will just "squash" the
binary smaller. It will also increase loading time.
Look for a version compiled for the 8088.

There isn't. I should have been clearer. 'digi' is an abbreviation for
'digipeater'. They're the same thing.

They are NOT the same thing as a realtime repeater that happens to be
repeating digital signals such as packet. That's sometimes called a
'digital repeater' but because of the confusion of terms, most people
call them packet repeaters (if they call them anything printable, that is.)

>In common usage, here in Australia, the

No offense, but what did you expect from USFG/NTIA bureaucrats? The users were about to lose justification for tying up frequencies which could then be auctioned to the highest bidder. Just so you understand that I'm not just picking on the Feds, several technically advanced hams or clubs have tried the same thing on their repeaters operating in the amateur bands, and the whole progressive idea fell apart there too. Voice users would not time-share the repeater and refused to either buy CTCSS for their rigs or tolerate the squawks. Sometimes you really DO have to legislate technology advances, even when the action taken is merely to prohibit the continued use of methods that have been obsolete for twenty years, such as carrier squelch and only one repeater on a channel pair in an area.

Source record: 38552

Hi,
I'm pretty new to this packet stuff, and have a question. What
I want to do is be able to connect to my home PBBS from elsewhere, to
read my mail, etc. Now, other people can connect to my PBBS just fine,
but when I try to do it, I can't connect. MYCALL is KI7FL and the PBBS
is KI7FL-1. I'm using both a KAM and a KPC-3. I guess maybe it's a
problem with my home station and other station both having the same
call, but how do I fix it?

Any help is greatly appreciated.

Russ KI7FL

3B8 - [Mauritius] Since 16th February , for two weeks , Peter - DK1RP
from Jacky's QTH (3B8CF).All QSLs for the contacts will be sent
via the bureau.[A good example to follow].
3V - [Tunisia] Starting 1st of March until 10th , DL8HYR (Frank) is
going to 3V8BB.Mainly on Satellite and EME.Possible operation
on the low bands.
YT1AD also from 3V8BB during the CQ WPX SSB contest.QSL via H.C.
5X - [Uganda] ON6TT (Peter) is in mission for the United Nations.
This could take from 6 moths to 2 years.He will be active from :
9X, 9U, 9Q, 5H, ST, ST0, T5, 5Z, E3, ET etc.Operation from Uganda
mainly on SSB/RTTY , CW on request.QSL via ON5NT.
8Q - [Maldives] HB9CYU (Chris) and HB9CZR (Rolf) , from 14 to 20 Feb. ,
as 8Q7YV and 8Q7ZR.
9L - [Sierra Leone] 9L1JC (Jim) his QRV until August 96 .
C56 - [Gambia] DL2RUM ,DL7BO ,DL7DF ,DL7UFR and DL7URH will be QRV :
CW : 1.822, 3.505, 7.005, 10.115, 14.005,18.073,21.005 MHz.
Also on operation on SSB.Look for the low bands and maybe on
Satellite AO13 , 6 meter are also possible.QSL via DL7DF
(ex-DL7UUO).
CQ5_ct - [Portugal] CT1FMX and CT1EWA plan to work from "Nazare'
LightHouse" (Ref: FBL-04) from 23 to 25 February.
The Callsigns issued for this event were : CQ5FMX and
CQ5EWA.This activation also counts for the Portuguese
Castle ' Awards , "Forte S.Miguel Arcanjo " , (Ref: F-027).
QSL via Bureau or Direct to Home Calls.
```

DL_ant - [Antartida AN-016] An new HAM is QRV from DP0GVN (Alemc Georg
Neumayer) - Ref. WABA DL-03 IOTA AN-016.This station is located
in the Princess Martha Coast.
EJ_iota - [Great Blasket EU-009] From 7 to 10 July the WestNet DX Group
and some HB9 op. will activate the Great Blasket Island (EU-007).
The Callsign is EJ7NET and QSL goes via EI6FR.
FS - [St. Martin] From Feb 22th. to March 6th. N0BSH using call
FS/N0BSH.He will enter the CQ 160 SSB Contest and ARRL DX
SSB Contest together with WE9V and WX9E at FS5PL.
QSL for FS/N0BSH via N0BSH , for FS5PL via WX9E (Only for
the Contest Operation).
Look for Mike's correct address below on QSL info.
Operation from 10 to 160 mtrs + WARC Bands , CW + SSB.
J6 - [St.Lucia] Until the end of February , YT1AD his QRV from St.
Lucia with the call J68AD.QSL via Home Call.
Also from 9 to 23 of March , Walter , DL6SDS is going to operate
as J6/DL6SDS.
JX - [Jan Mayen] JX9ZP is QRV from this Island , where it works !
OA_ssh - [South Shetland] During one month , OA0MP from the Antartic Base
"Peruana Machu Picchu" (WABA OA-01) located in the King George
Island (62.04S-58.27W).Special atention to the weekends around
23.00 UTC on 14.260 Mhz.QSL via OA4WM.
P5 - [Korea do Norte] Possible operation in February by OH2BH and
OH0XX.
PY0_iota- [Trindade Isl.] PY1UP is staying in this Island till March 96.
He his QRV on SSB/CW , 80 to 10 meters.Ref. for Awards are :
IOTA SA-010, DIB-02, DFB OC-04. QSL via PY1UP , see address below.
The callsign issued is PY0TI ...
S0 - [Western Sahara] EA2JG and some EA's will be active as S020R for
a whole week , starting 20 th this month.
They will be QRV on the usual bands , SSB and CW.
QSL via EA2JG , only direct.The Adress is listed below on QSL
info.
SJ9 - [Sweden] SM0DJZ will be on Morokulien , from 15 to 19 February
for the ARRL CW Contest and DARC HF RTTY Contest.Morokulien is
located between Sweden and Norway so John will have two calls
(for DXCC) SJ9WL [SM] and LG5LG [LA].QSL via SM0DJZ.
This is a good chance to "get" the MORKULIEN AWARD.To have more
information contact SM0DJZ !
UA0 - [Zone 23] UA0YAY is QRV from Oblast 159 - Tuva , CQ Zone 23.
QSL via Box 40, Kyzyl 667011, Tuva, Russia.
V4 - [Nevis] N0BSH will be QRV from V4 starting Feb 14th to 21th.
He will participate in the ARRL DX CW Contest.The callsign
is V47NZ.QSL via N0BSH (See below , on QSL info)
Operation from 10 to 160 mtrs + WARC Bands , CW + SSB.
VK8_iota- [Melville Island] From March 8th to 11th 1996 , two VK8's will
be QRV from this Island.They are : VK8HZ and VK8NSB.
Operation from 6 to 80 meters.QSL via VK4AAR (only direct).
Correct address of VK4AAR on 95 or 96 callbook.
The operators will be on the air at the same time with two

stations.Dates and callsigns can change ! The IOTA Ref. is OC173.
VK9C_+X - [Cocos Keeling & Christmas Is.] DL8WPX, DK7YY, DL3DXX and DL7UFN
will be active from Cocos Island as VK9CR , from 13 to 22 Feb.
and later as VK9XY (Christmas Island) , 23 and 24 February.
QSL via DK7NP.
VP2E - [Anguilla] AA4NC is in Anguilla until Feb.20th with the call VP2EN
Also from this spot KC0ZC (VP2ES) , WA0PUJ (VP2EZ) and N0ZS (VP2E)
starting Feb.28th to March 5th.QSL via Home Calls.
VP2M - [Montserrat] WA2UJH will be back in Montserrat .He will operate
with the call VP2MDY , from 16th February to March 1st.
Operation mainly on CW , 160 to 10 meters.QSL via NW8F.
XZ - [Myanmar/Burma] OH1MA, OH1RY, OH0XX and OH2BH , with calls XZ1A
and XZ1R from 20 to 28 February.
ZF - [Cayman Is.] K3DI is going to participate in the ARRL CW Contest
(17/18 Feb.) as QRP.Callsign is ZF2OP.QSL via K3DI or W3-Bureau.
ZK1 - [South Cook Is.] K8PDY and WT8S expect to operate from S.C. Isl.
from 17th to 24th February.Operation mainly on CW/RTTY a some on
SSB.Callsigns are : ZK1PYD and ZK1WTS.Also very active is ZK1DI
with strong signals on 40/80 meters.QSL via DK1RV.
ZL7 - [Chatham Island] Barry (ZS1JF/G3MFW) will be QRV from this Island
, 15th to 19th February . This is mainly an SSB DXpedition.
The callsign is not issued yet.QSL via KA1JC.
ZS - [Africa do Sul] Our CT friend in South Africa (ZS6AOO) is QRV as
ZSM6A until Feb 21st. QSL via WA3HUP.
ZW5 - [Brasil] Imbituba Lighthouse (DFB SC-09) , from 15-25 Feb.
Operation on SSB/CW from 80 to 10 meters.QSL via PP5VB , address
below (on QSL info).Callsign to be used is ZW5IZ.
ZW8_iota- [Grande Santa Izabel Isl.] Activity starting 16th February till
20th.The Ref. are : IOTA SA-025 , DIB-19.QRV from 80 to 10 meters
on SSB/CW.The callsign issued is ZW8P.QSL via PS8DX.

4K3/RA3YG JI6KVR/6 LU3CQ/D AZ1D
VK6ISL VK8ISL TI2LAK/HP4

He does not QSL via Bureau , only direct to :
I1HYW, Gianni Varetto, P.O.Box 1, 10060 Pancalieri (TO), ITALY

Info BV9P QSL Cards -> KU9C (BV9P QSL Manager) is waiting for the QSL
Cards from W4MPY.The first package of QSL's should be out till February
29th.Steve is counting with K2PF for help . They everybody to have the
QSL's ready for submission in April 1st.For those who want a QSL via
the bureau just send a note to Steve with the QSO details and he will

reply via the bureau (Don't need to send QSL!).An QSL scan is on the web page [http://www.mindspring.com/~w4mpy] .

Lacepede Island DXpedition -> VK6LC is organizing a DXpedition to this Island and the Diamond DX Club asks for help on support ! Send your donations to :Diamond DX Club ,c/o I1 HYW, Gianni Varetto ,P.O. Box 1 10060 PANCALIERI (Torino) ITALY. This Island has no IOTA Ref. , they plan to give this one a new ref. just like CO0OTA , CO1OTA , VK6ISL , VK8ISL , YB5NOC ...

KC6 and XX9 by JH2MRA -> Hirotaka Asaoda (JH2MRA) is planning a DXpedition to Macau and Palau.He his trying to get an XX9 call and already has the call for Palau , he expects to go there when propagation gets better. The call for Palau is : KC6PX and KC6PR (His XYL).As soon he has more info on this we expect to inform you ! More info contact :
Hirotaka ASAODA - JH2MRA/AA5YM/PY0ZFB : jh2mra@yk.rim.or.jp (Internet)

HEARD ISLAND -> The Heard Island DXpedition Team it's reorganizing for their 96-97 operation.They have already rented a new vessel ("Marion Dufrensne"). The team is composed by : EA8AFJ (Michel Sabatino), HB9AHL (Willy Rusch), KA6W (Ted Algren), K0IR (Ralph Fedor), KK6EK (Robert Schmieder), N6EK (Bob Fabry), NP4IW (Carlos Nascimento), ON6TT (Peter Casier), PA3DUU (Arie Nugteren) e RA3AUU (Igor Harry Booklan).Any contribution should be sent to ON6TT.

KERMADEC DX'PEDITION UPDATE -> License and equipment are in hand.The boat they will take should make some stop-overs in Crozet and Kerguelen.Some operation from this Islands is possible !

RS12/13 Satellite info -> This bird has changed the operation mode to T. Now to use the satellite you will need two equipments, one for 21 Mhz and other for 145 Mhz (Both with SSB).It's equiped with a linear transponder (Up SSB / Dwn SSB).The Uplink is in 21 and Downlink on 145. The freq. :

UPLINK DOWNLINK

Robot : 21.170 145.907 : Beacon

: I then have to use a hard reset to reset the TNC and then
: change all parameters again, etc, etc.

: Its becoming quite a drag because I now have to leave it on
: 24hrs a day.

: Is the internal battery maybe at fault - but why doesn't it
: reset to defaults when switched on again?

: Please help.

: Marinus
: ZS6MAW
: willemma@telkom19.telkom.co.za

I don't know anything about Winpack, but I do know that the KamPlus has
a host mode. Is it possible that Winpack is talking to the Kam in
host mode and when you turn it off and on, it drops out of host mode into
command mode???

Just a possible reason.
After you turn it back on, drop out of Winpack and bring up a terminal
emulator and see if it is talking to you that way.

Jim.

: 73,
: Ralph
: WA9JST

I have to put in my 2 cents worth. I have used the KAM+ and still
prefer my PK-232. I think it receives weak signals better. The manual
for the PK-232 is far superior. In fact I think you could say
there isn't a manual for the KAM. Just a few scraps of paper with
little intelligence written on them. If you will be running software
that does all of your thinking for you, then that doesn't matter,
but if you would like to interface with your hardware, buying a KAM
will be frustrating.

Jim.

Jim I have as many concernes about this "secrecy" thing on the weather service digital broadcasts as you. I considered asking the local congresswoman for help, but I think if we contact our local guys at NOAA we'll get to the goal faster than any damn fool congress person. The local guys want us to have that info as badly as we want it. Can you make contact locally? I will do so again to get the name of the Canadian manufacturer. Cliff Buttschardt W6HDO

>open spot... when that occured, between voice transmissions, the data packets were
>furiously exchanged!

How well this works is very dependent on the technology in use at the
user's stations. When they use traditional TNC firmware or well-working
SCC card drivers, it will probably work nicely because the programs are
patiently waiting when there is continuous carrier detect. As long as
the voice users are active, the packet users are effectively in a state
of suspended animation.

When they use something KISS-based, or software in which the AX.25 layer
is unaware of the DCD state (like the SCC driver in xNOS), it will be
disastrous. The layer-2 (or higher) software will repeat each packet as
determined by the timeout timer(s), but these repeats will only be
queued in the TNC or the driver. As soon as the channel becomes clear,
all these queued packets are sent, and you will see many duplicated
packets on the channel. The handling of this condition is often not
optimal, and with some very buggy software it can even result in a
pathetic loop where each packet is sent 2 or more times, and REJ
responses are sent every time.

It is a pity to see that a system that worked well when first designed,
was later corrupted by the not-so-well-thought-out design of the KISS
TNC, and the DCD-unaware level2/level1 interface that resulted out of
that.

>Is it a E version problem???

>Do you know why this happen???

I have never seen such a TRX myself, but when I helped someone else
over-the-air I noticed that the input is apparently very insensitive.
The other guy had increased the deviation setting on his modem to the
maximum, but still had only 1 KHz or so deviation.
He had to build a separate audio amp (using an op-amp).

Maybe you have a similar problem, and your modem provides even less
audio output so you think you have no data output at all?

>type packet, as well as decode other data transmissions, such as pagers,
>both digital and alphanumeric, DTMF tones, and other various data

I haven't seen anything that did pagers, but if you're interested in a wide variety of signals (i.e., not just packet and sstv/fax/rtty/amtor etc), you might be best off with a DSP rig such as AEA's DSP-2232 (model number?)...

Could someone who knows about such things continue on this point? Have people written "interesting" modes for the AEA DSP rig?

1022. HTX-202 and MFJ

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-15 00:00:00 UTC
From: aa5mt@gate.kc5aug.ampr.ORG
Message-ID: <54852@gate.kc5aug.ampr.org>
Source record: 38561

HOOKUP FOR RADIO SHACK HTX-202 TO MFJ TNCS

This document is for customers of MFJ who are having problems getting their system connected and operational.

1. MFJ-1270/1271 tnc with no internal network:
All the components must be assembled into the hookup cable between the tnc and radio. The HT requires a mono plug on both of its' jacks, however, a few people have reported that their HT would operate with a stereo plug. There may be two hookups over the years that the radio has been out. The MFJ hookup cable will not work with the 1270 and 1271 because the connection network is missing from inside the tnc. Locate the two parts of the cable and note which color wire goes to which part of each plug. There should be a cable for the radio with 2 plugs on it, and a 5 pin DIN plug for the tnc, both with a loose cable attached, to be spliced together. First, on the tnc cable, locate pin 4 on the DIN connector. The MFJ color is yellow for the receive audio line. It should be connected to the tip of the large radio plug. Also connect pin 2 of the tnc to the ground sleeve. The ground usually is common to the dual ht connector, but you may want to split it for separate ht plugs. Next, for the transmit plug, connect a 2.2k resistor to pin 3 of the tnc, and a .01 capacitor to pin 1 of the tnc. Connect the capacitor and resistor together on the radio side, and connect it to the tip of the small radio connector. Connect the ground to the sleeve of the small plug.

2. MFJ-1270B/1274:
This model is much easier to connect, since it has the RC network built into it. Connect pin 1 of the tnc to the tip of the small plug, and pin 2 of the tnc to the sleeve. Connect pin 4 of the tnc to the tip of the large plug on the radio. Only three wires are needed for the hookup - transmit, receive, and ground. Inside the tnc next to the radio jack is R107. You will need to change it to a 2.2k ohm value. The original value was 47k, and later it was 4.7k. Next, locate a small white rectangle off of one end of R107. The two solder pads inside the rectangle make up jmp K and need to be soldered together, or connected in some other fashion. This ties the PTT and mic audio together(AC and DC).

3. MFJ-1270C/1276/1278/1278B:
These models have the same cable hookup as the 1270B/1274. The internal components have different locations and numbers on the resistor. All of these use jumper L instead of jumper K. The 1278/1278B uses both jumper K and L, depending on the radio port used. More information on locations are in the chapter on radio hookup,

page 21 in the 1270C/1276, and chapter 3 in the 1278/1278B manuals.

Special Note:
In many cases this arrangement will work just fine. Through feedback from customers, the value of the resistor can be of a different value from radio to radio. The values seem to be from about 500 ohms to around 5000 ohms. I recommend using a 5000 ohm potentiometer for the initial installation, an adjust it for the best performance. When the value is too low, the radio will key all the time, and when too high, it won't key at all. A balance point is somewhere between. Remove the pot and measure it, and replace it with the closest standard value for permanent operation.

1023. using Macs to switch stuff on/off?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-15 00:00:00 UTC
From: skoenig+@cs.cmu.edu
Message-ID: <4fu8fp$9mt@casaba.srv.cs.cmu.edu>
Source record: 38562

I would like to use my Mac to switch a couple of low-voltage devices
on and off. Are there any "cards" (Mac specific ones or, more likely,
ones with a standard serial interface) that do just that?

Also, where to look for AD/DA converters and relay cards?

Every hint is appreciated...
Thanks!
Sven

1024. Winpack V5.4 Here!!!

Hi I have finally found winpack V5.4 which is a very good program
deffinently worth installing runs with BPQ.

ftp://ftp.funet.fi/pub/ham/packet/terminal
and the file is winp540.zip

bpq is also on there in

/pub/ham/g8bpq

Have fun......

I think they have only two options:
1. If they have license and use HF packet or some digital ham mode to send E-mail
to internet via a packet/internet gateway, which will only give them mail delivery.
2. If the boat has Inmarsat A or B satellite communications they could use it to
dial in by regular modem up to about 9600 baud to their internet provider. This
costs $8 to $10 per minute.

1026. Information on equipment sought by new Tech

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-16 00:00:00 UTC
From: tomz@premier1.net
Message-ID: <DMuJuB.GLH@data-io.com>
Source record: 38565
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

Hi,
I am going to be taking my Tech tests on Saturday (2/17) and am now starting to look in to what type of radios to get. I plan to put a 2M Mobile in my truck and get a more substantial base for home.

For home I'm looking into Base Multiband / Multimode Transceivers and trying to decide what will be my best bet. I was thinking of one that would cover at least 2M and perhaps 70cm. I am interested in working into Satellite and EME as well as FM and perhaps some local CW, 12V operation would be a plus but not a major requirement. I do plan on upgrading to at least General with in the next year and expanding also into some HF as well. So I would want to take that into consideration as well. possibly using Transverters get to the higher freqs for satellite and EME and going with a more basic UHF/VHF base unit.

For the mobile unit I was thinking of a rather simple 2M unit for repeater and simplex FM. I live in a rather remote area in the western foothills of the Cascades so I think one of the higher output power units would be in order. I was considering picking up one of the new Radio Shack units. As far as I can tell it has most everything I am looking for at a reasonable price. From the cross talk I have seen on the net and the write up in CQ (VHF) it seems to be a good choice.

I would like to take advantage of the wealth of experience of those out here on the net and get some input from you as to what you think. Suggestions on equipment to get or avoid as well as things to look for or useless features to not even consider. For me price, value and reliability are important, I have a modest but hopefully adequate amount set aside for starting up and want to use it wisely. The Base unit I'll be looking for used at up coming Ham fests so any information about current or older equipment would be helpful. I was thinking of picking up the Mobil new (if it is in or around the same price range as the Radio Shack unit) but am vary open to suggestions. I would also welcome comment on other accessory gear that you feel would be useful as well as thoughts on band selection (pros and cons of the diffrent amature bands) or what ever info. you would like to pass on to a newbie like myself. I know there are lots of books and other sources around and would not mind pointers to the better source like that, but I am primarily looking for personal insights and experience.

Thanks
TZ

RICKCRIDER (rickcrider@aol.com) wrote:
: In response to the ARES/RACES newsgroup, I would support such a maneuver
: if others would.

I have a suggestion. Since ARES/RACES is about emergency communications, we should consider making the new group more general to include other emergency communicators such as CAP, USCG-Aux and MARS. By widening the group to include all interested in emergency communications we will get more activity and a cross-fertilization of ideas.

The group could have a name like rec.radio.emergency-comm.

While I've been a ham for over 20 years (good grief, I just realized I'm now eligible for QCWA!), I'm also actively involved in Civil Air Patrol communications.

The PK232 will do fax and all you need to do is to use the program
that interfaces with the 232 as a terminal. The command for wefax
should be in you manual and there is a print con command you can set
to print out the data onto you printer. I have not found a way of
displaying the data on the screen yet. Make sure you printer is
connected to the pk232 or your terminal program can re-route the
output to the printer...

For those of you who run JNOS under OS/2 or PMNOS 1.2 I've
uploaded the latest version of the OS/2 PI card drivers
to hobbes.nmsu.edu/incoming/PI2DRV10.ZIP . These drivers
allow JNOS running in a VDM to use the Ottawa PI or PI-2 card.
All source code is included.

File Descriptions for PI2DRV10.ZIP

PI2DRVR.SYS Version 0.93
An OS/2 device driver for the Ottawa PI card.
Supports both original and PI-2 cards.
Supports both A cnd B channels.
Can be used with PMNOS 1.2 or JNOS.

VPI2.SYS Version 1.01
An OS/2 virtual device driver which allows a modified
version of JNOS to use the PI card when running in a VDM
under OS/2.

NOS.EXE
JNOS110i compiled with a replacement PI driver for use with the OS/2
drivers.

PI2DRV09.ZIP
Source for OS/2 PI card physical device driver. Version 0.93

VPI2.ZIP
Source for OS/2 virtual device driver 1.01- allows JNOS to use OS/2 PI card driver

PI2-JNOS.ZIP
Source for JNOS replacement PI card drivers. (Must be compliled into JNOS)

For the receive-only listener, check the M-8000, M-4000 and M-1200
decoders offered by Universal Radio, Inc. Each includes some of the
common paging formats in addition to RTTY, AMTOR, etc. Certain of
these decoders also include DTMF and AACARS. The price ranges are from
$1350 down to $400.

Universal can be reached at (614) 866-4267 (Columbus, Ohio).

In connection with the above-mentioned tests we have done many hundreds of
file transfers in amtor, gtor, pactor and packet between about 8 different
KAMs. Some were pluses (the one here, for example); others were v7.1 and
v8.0 upgrades.

I can remember about 4 or 5 lockups among this group of units over the
course of about 6 months. In one case a v8.0 KAM upgrade locked with its
tones idling back and forth. A hard reset slapped it back to health,
where it's stayed.
Our own KAM+ locked with one tone lit once; a reset brought relief. A
couple of the KAMs we're testing with (one a v8.0; would have to check on
the vintage of the other) have locked up sending acks continuously for
hours until reset. One was sending amtor acks, one gtor acks. (Those
happened to be the modes chosen at the times of the lockups by our test
program.) Resets stopped the rot in each case.

Have heard that lockups of these types can occur if a busy KAM is not
connected to a running computer, which is said to cause buffer overflow.
Kantronics may have pointed this out, but I'm not certain of that. In
some of the cases we've observed, the computer was on, so this can't
explain all failures.

Have also experienced some VHF hangups, but they're rare. --KB1JY

Thanks, I'll check that out.

I wonder, what is different about TNOS that allows this? It dosen't work
with JNOS versions I have tried. In fact, there are many a comment in NOS
docs that say running NOS with detached stdin is impossible. Is TNOS
smarter?

I think YOU need to RTFM. NOS/JNOS/TNOS has been unable to run detached for
as long as I can remember. Maybe you should try your suggestions if you
don't believe me. They don't work. All the releases I've tried need a
terminal.

Oh, and yes, one thing you mentioned was not familiar to me: what exactly
is an "autoexec.bat"?

:)

I just did. Sheesh! Didn't anybody take the time to READ my post. The
technique given in the FAQ requires redirection to some controlling
terminal.

I want to run TNOS as a DETACHED process in the background. That means I
don't want it associated with a controlling terminal. This has been
impossible in the past and still seems to be impossible.

And that's a FAQ.

>"This content in no way reflects the opinions, standards, or policy of
>the United States Air Force Academy or the United States government."

Hello Russ.

You're exactly right - it's being caused by both TNCs having the same call.
The remote PBBS unit, see a connect from you (KI7FL) and notices that the
MYCALL in that TNC IS KI7FL, so the PBBS thinks it's an "internal" connect.
It's trying to talk to the serial port, but you're at a remote location.

Simply stated, each station on the air at the same time, in the same band,
needs a different callsign. I would suggest using KI7FL-2 or some other SSID
in your portable station. Don't choose an SSID that conflicts with other
functions of your TNC, though.

1043. Digital Signals FAQ v3.0 released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-17 00:00:00 UTC
From: sscalsk@atc.ameritel.net
Message-ID: <SSCALSK.96Feb17164804@atc.ameritel.net>
Source record: 38447
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.digital.misc

For those of you interested in digital signals and shortwave utilities, please check out the new Digital Signals FAQ V3.0. It is available for ftp/http from:

ftp://ftp.leonardo.net/berri/wun/archive/files/misc/digfaq30.zip
http://leonardo.net/berri/wun

Its a large document, approximately 150K, so I will forego posting the whole document. The document details most known digital signalling systems found to date in the shortwave spectrum, along with system parameters, decoder manufacturers and references and has been greatly enhanced since V2.0. Well worth a look if you are a beginner or expert.

Questions, comments or requests can be directed my way.

Stan Scalsky

Since I *discovered* HamComm, I have been happily RTTYing and AMTORing on the high frequency bands. HamComm is one software package truely worthy of the shareware registration fee. However, I want more. Is there an equivalent software package out there capable of running PACTOR with a homebrew interface instead of a high-priced multi-mode controller?

Hi,
First I would be sure to get a unit that does both UHF/VHF. There are now more UHF repeaters in some states (Texas for instance) than VHF! The Yaesu 5100 is a good choice as are some of the kenwood, icom, and alinco models. I like the one that allow for 2 V's or 2 U's as well as a V and a U at same time.. so look for that.

For satellite work you need All mode rigs (CW/SSB).. they are considerably more expensive than the FM variety. You can use transverters from an HF rig, but you will lose features like auto doppler shift correction etc. AND if you want to work some of the satellites that have UHF/VHF/HF capabilities it becomes difficult with the transverters in line.. but not impossible.

Get a good FM Dual bander... learn about the hobby from a local club, see if others are into satellites and find out what works for them. Grab the general/advanced and then have fun!!

73 hope this helped a bit.. perhaps others will comment.

If you want to join our listserver (we are in Houston TX) you may do so and post your question out there... to subscribe

MacRatt III v1.oa is out and I have looked at it, used it, kind of, and the results are far from satisifing. AEA's support folks are clueless about the software, and about Mac's as well. I would like to exchange critiques with anyone elso that is trying to make this package work with a DSP2232. It absolutly does not work with a pre MBX PK-232. You must have the MBX upgrade to make this package work. I have the bleeding knuckels to prove it before calling the support line, and confirming the fact. Upgrade to MBX cost more than the software. The doc's are very sparce in the dual port Tnc support area. The GUI is better than the 2.0 version, and it does support the CommToolBox and standard Printer Interface finally. It does not support the WEfax mode that v2.0 did, and support for Gtor, SSTV, is also missing. Maybe AEA will catch up with MacRatt III v 2.0. Only time will tell. Bruce

Hi everybody,

l am a CS student from Albania at an American College in Bulgaria.
l would like to set up some packet radio (between me and some friends) in Albania. l don't think there exists a packet radio network in Albania as of now, although l have heard some foreigners (who work in Albania) communicate via radio.

l would like to know about the cost of gear that handles 9600kb/s or above, and especially if there is such that does this (or higher) in very mountainous areas (10-15 mountains of 1500-2000m between the points to be connected). l am considering commercial stuff as well.

Please let me know about manufacturers and dealers in Europe (the closest to Bulgaria the better -- l don't think l could afford airmailing such gear)

If the cost is not prohibitive l believe radio is going to boom in a near future in Albania, since the majority of the villages have very bad to nonexistant telephone connections and not much improvement is expected in the near future. (For many villagers it takes some hours drive or walk to the nearest center that has a moderate telephone connection - which still cannot reach more than a small area around)

If anybody is interested in contributing to and gaining from such a business , contact me at: enb950@cos.aubg.bg

Regards,
Edi Bice

The originator of the thread is in the USA; it's illegal (a patent violation)
to use the European version there.

>US version has been doctored. Try a web search for PGP or RSA. If all

I was under the impression that the source had been published. For it
to be doctored, the RSAREF source would have to be unbpublished AND
would have to be responsible for the randomness (and primeness**) of the
RSA and session keys (although for amateur radio use, you are only
interested in the RSA keys). Are both these the case?

(RSAREF does have a limit of 1024 bits on the keys.)

** Primeness is only an issue for the RSA keys. It is not really at risk
from doctoring, as one could do a primality test on the generated keys
to eliminate this possibility - any failure would discredit the owners of
RSAREF.

BEWARE OF DELAING WITH DERRICK HALL OF SEATTLE, WASHINGTON!

On November 17, 1995 I sent him a money order (as he and I agreed) for a PK232. He claims to have sent the package but that it was returned. I assured him that the address in my letter that accompanied the money order was correct (a mail center) and to resend the package. As you dear reader, have guessed by now, no package.

I have called Mr. Hall on 12/1, 12/11, 12/12, 12/13, 12/17, 12/18, 12/19,12/20/95, 1/2/96, 1/15, 1/22, asking for either PK232 or return the money! No money, no PK232.

He sent me this message:

*** Forwarding note from DERRICK --PB1 01/22/96 16:05 ***
"To: jcscott@PacBell.COM

Subject: NOTE 01/22/96 16:05:00
I Got your message, that you call this morning. I sent your Money order in the mail on friday, I think it was after 5:00 when the mail stops up here so it should have went out on saturday. It does not matter if you try finding my employer be cause I am the employer so if you wanted to say someting you could call me up. Why do you think i be gone so much. Well anyways your money should be comming with in a few days. And don't call me back!!!!!!!"

I attempted to respond with:

"Subject: NOTE 01/22/96 16:05:00
Derrick
I have called and paged you numerous times with no return call. Specifically I called and left messages on 12/11, 12/12, 12/13, 12/17, 12/18, 12/20, 1/2/96, 1/15, and 1/22.

I originally mailed you the money order on 11/17/95 so you can see why I upset about "no communication" from you, no PK232, and no returned funds.

When the money shows up I will cease to call and bother you.

NOTE 01/22/96 16:05:00" F

My response to hime was rejected. The postmaster on his system responded with:

" Subject: Identify User
Your email to Derrick Hall is being rejected because he has run out of credits. When he purchases time, he will be able to receive email again."

I called Mr. Hall again on 2/6 and 2/15, same results, no money, no PK232. On 2/15 I offered to mention his business practices on the net and this note is the result.

If any body in Seattle reads this and employees this man (I think he is an independent contractor) be sure you are getting good value for your time and money. He is not very honest in his dealings on the Internet.

:>
:>Jim.

Well, to put it quite bluntly, you must have had a bad day. I can't imagine ANYONE who can't get a KAM+ working on the first try. I've used the original KAM and the KAM+ for years and I had NO problems with either of them. The 232, however, was a lesson in frustration on the 2 occasions that I've attempted to get them working for fellow hams. They simply don't lend themselves to working with generic comm programs, while I've used modem comm programs of many sorts to interface with a KAM+.

I also don't agree with your comments about manuals. I had no problem understanding anything in a Kantronics manual. Fairly concise and to the point. Plenty of intelligence for me, but your mileage certainly seems to have varied.

Given a choice, I'd still pick the KAM over the 232 any day. Full dual port functionality for the same (if not lower) price of a 232. I'm much more interested in being able to switch radios/ports at the slightest whim, right from the keyboard with just a couple of strokes. Couple that with the built-in node function (which, the last time I've heard the 232 still doesn't have) that lets stations cross-band from HF to VHF or VHF to HF, and you have a very nice TNC that proves more functionality (especially from a

packet standpoint) and versatility , IMHO, than a 232.

Just an opinion from a satisfied KAM owner.

The first thing you need to get is an amateur radio licence, although you could monitor the packets other people are sending with just your scanner, a TNC, and some ordinary comms software running on your computer. The TNC includes a modem chip, and a microprocessor, and connects to the computer via a serial port, just like an ordinary external modem. The TNC is also connected to the microphone input and speaker output of the transceiver, with another connection to the PTT input, so that the TNC can switch the transceiver between transmit and receive. For ordinary packet this is all you need. For TCP/IP, you need special software running on your PC, similar to that used for accessing the Internet. A version is available for Linux.

You can manage with just a modem chip, and a few other components, with software performing all the other functions of the TNC running on a PC. This is how the Baycom packet system works.

It is also possible to use a DSP-based sound card (like the Cardinal), with software running on the DSP and the PC, for 1200 baud and 9600 baud packet. A small hardware mod. is required for the PTT connection.

All,

Here in Fort Worth, Texas - they have been testing what is known as County Specific Warning System. - it has been around here for about 3 years now... When a Watch is issued- the NWS person who is putting out the watch selects what type of watch, and the counties to be alerted on a console on the NOAA WX radio rack... This console is a flat panel with a bunch of selections for different types of alerts.

When the watch goes out, normal program is interupted and 3 digital bursts of abount 2 or 3 seconds is heard followed by the 1050 hz alert tone to activate the current generation of wx radios. There is no text going out in these transmissions, just codes to activate the radio.

(I dont know about you but I hate being woke up for something that passed through an hour ago).The new radios will allow you to select which counties to alert you to and what type of alert you want to get.

(I havent seen a commercial version of these new radios yet).

Is there a shareware PACTOR program (like 'PCTOR' which does AMTOR?)

I have BMKMULTY (1991) here which works fine with my AT and CP-1...but
I've not heard anything about this software for ywars...and the last
time I *did* hear about a PACTOR upgrade, it was something like
$75.00...which is a bit steep for me at the moment.

1065. TAPR Announces new Web Page on Amateur Audio News Programs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-18 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <253249.ensmtp@teachnet.edb.utexas.edu>
Source record: 38455

TAPR makes available Amateur Radio News Services on the Internet.
Feb 18, 1996

TAPR is proud to announce the creation a new set of web pages that focus on Amateur Radio News Services. This page can be reached from the tapr home page http://www.tapr.org

This new page contains audio from Amateur Radio Newsline, the RAIN Report (Radio Amateur Information Network), and Ham Radio and More. All audio is provided by the RealAudio system. RealAudio players are available for Mac, Windows, and UNIX based computers. We are currently only encoding for 14.4Kbps access speeds, to lower the consumption of our hard drive space. We will be looking at doing more 28.8Kbps+ speed access encoding later in the year.

These audio pages will be updated in different manners. Newsline is updated each week. The RAIN report is a monthly service. Shows from the national hour of Ham Radio and More are being made available on a 'best of' selection.

TAPR hopes that this page will help make these amateur radio news programs more readily available to the amateur community.

The Ham Radio and More 'Best of' currently includes:
* Bob Bruninga, WB4APR, Author of APRS
* Greg Jones, WD5IVD, President TAPR
* Dan Meredith, N7MRP (Packet, the Internet, and more!)
* Phil Karn, KA9Q (TCP/IP and Spread Spectrum)
* Dick Daniels, W4PUJ (Phase 3D and AMSAT)
* Lyle Johnson, WA7GXD (Packet Radio)
* Lew McFadin, W5DID (SAREX Project)
* Jack Tiley, N7RWJ (Spread Spectrum Communications)
* Lyle Johnson, WA7GXD (History of Packet Radio and TAPR)

With more to be added in the coming months!

You might note the slight bias towards digital topics :-)

NOTE: TAPR is currently only supporting 5 audio channels currently. If you get a busy connect, just try again at a later time.

VOLUNTEER? We are looking for people who might be interested in setting up a rotation for doing the Newsline encoding. If you think you might like to help record and then encode the weekly Newsline feed for the page, please contact

TAPR@TAPR.ORG and let us know. Having a rotation should make it easier to keep this page current.

1066. TAPR on the Internet: Periodic Announcement

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-18 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <253255.ensmtp@teachnet.edb.utexas.edu>
Source record: 38456

Greetings from TAPR!

TAPR is available via
* listserv (listserv@tapr.org)
* FTP (ftp@tapr.org)
* WWW (http://www.tapr.org)

See below for full details on these and general information about TAPR.

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)
index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of
amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through
publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR
history.

The TNC (Terminal Node Controller) project grew from a discussion in
October of 1981 at a meeting of the Tucson Chapter of the IEEE Computer
Society. A week later, six of the attendees gathered and discussed the
feasibility of developing a Terminal Node Controller that would be complete
and available to amateurs at a modest cost. This was the genesis of TAPR.

On June 26th 1982, Lyle Johnson, WA7GXD, and Den Connors, KD2S, initiated
a packet contact with the first TAPR unit. The project progressed from
these first prototype units to the TNC-1 and then finally to the TNC-2 which
is now the basis for most amateur packet operations worldwide.

TAPR was founded in 1982 as a national organization with interests in the
areas of packet and digital communications. Today, TAPR continues as a
membership supported non-profit amateur research and development
organization. TAPR currently has more than 2000 members, worldwide. TAPR
continues to develop kits for the amateur community and is working actively
on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published
Packet Status Register newsletter. PSR has been published since 1982 and is
recognized as an authoritative source for up-to-date user and technical
information on packet radio. Much of the material in PSR is timeless. Back
issues may be obtained from the TAPR office. Membership in TAPR is $15 for
one year. In Canada and Mexico membership is $18 and outside North America
they are $25.

Join the amateur digital-revolution -- Join TAPR!

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of
SIG groups, send an e-mail message to listserv@tapr.org with the subject
line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name should be both your First and Last Name.

Current SIGs include:
SS Amateur Radio Spread Spectrum Communications
NETSIG Regional Networking SIG
BBSSIG BBS SIG
HFSIG SIG on HF Digital Topics
DSP-93 SIG for those that are building TAPR/AMSAT DSP-93 kits
APRSSIG SIG on APRS
TAPR-TNC SIG on TNC Technology

FTP users

The TAPR Software Library is now available via anonymous FTP. You can access the library by ftp access to 'ftp.tapr.org' in the directory /tapr. Login in as 'anonymous', with a password of 'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this URL:
http://www.tapr.org

What's here? A page of links (the Home Page), the TAPR Home Page, a page of Packet Pioneers and Contacts, a hypertext packet primer and FAQ, the amarteur radio audio news page and other RealAudio links, and much more.

>Jon Scott

One way to avoid these types of deals is to have the possesor of the
equipment send it COD. At least you get a package (no telling what's
in it) and the sender doesn't get any money until the package arrives.

I have purchased several things this way and, fortunately, have
gotten what I paid for. There is really no way to judge the character
of individuals who sell through the postal service.

1072. Release News: FBB v7.00

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-18 00:00:00 UTC
From: andy@g1dil.demon.co.uk
Message-ID: <31278a5c.2780820@news.demon.co.uk>
Source record: 38462

Hello SysOps,
18-Feb-96

This bulletin is to advise of the forthcoming "Evaluation Release" of
FBB Mailbox and Server v7.00

The software has been developed over the past 2 years to run under
MicroSoft
Windows and is in the final Beta Test phase at this time.

F6FBB has decided that a preliminary release should be made in order
that
those who wish to contribute can assist with final de-bugging. The
change
of platform has resulted in a complete re-write and so there has been
a
long and arduous de-bugging process already. Indeed the Evaluation
Release
will represent 64 previous Beta Test releases to get to the current
position.

There is still work to do, and so SysOps should not see v7.00 as a
finished
product. That said, I am sure there will be those who will complain of
bugs.
Don't waste time telling everyone, just tell us...

There is no, and will be no documentation with the evaluation release,
as
this has yet to be completed. This will accompany the "Official
Release"
at a later date.

As usual distribution will take place via many and varied methods,
mainly
reliant upon InterNet FTP sites in various locations. Keep a look out
at
ftp.funet.fi in the \pub\ham\packet\bbs\f6fbb area.

Copies will appear quickly at GB7BBS.#28.GBR.EU in the FBBFILES
directory.
Access is avilable 24 hours without password on +44.1746.862531 - this
site
carries more than 15Mb of FBB related material. I will also upload the
distribution archive to the WA6RDH BBS in Dixon, CA on +1.916.678.1535
as

soon as possible.

Meanwhile for those who have no on-line capabilities, you can send a sturdy
mailer containing:-

2 x 1.44Mb HD 3" -Formatted- diskettes
4 x International Reply Coupons (overseas)
1 x Return address label

to me by post at:-

Andy Witts
P.O Box 73
Bridgnorth
Shropshire
WV16 6YY
England

Mailers received with unformatted disks, no return address label or insufficient postage/IRC's will be placed in the trash can outside!

I will turn around these disks at my earliest opportunity.

Hi,

Does anyone knows what is the Latest version of HAMCOM program,and what
are the new features it includes ?
I have the Ver.2.1 and I built the Modem (actually the Comporator) and
use it on RTTY but the performance was not very good ,I could only detect
the Strong signals.On the other Hand the modem is working fine with
the JVFAX program for SSTV (Great program !!!).
Any Ideas about how to improve the RTTY reception with the HAMCOM ??

1075. Re: JNOS lite ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-18 00:00:00 UTC
From: scotth@exit109.com
Message-ID: <4g899a$kub@news1.exit109.com>
Source record: 38465

Go to the ftp site at ucsd.edu. There you will find the latest version of JNOS compiled for the 8088. The file name is "JNOS110M.EXE". Make sure you also get the file "DOCS110M.ZIP". This file includes documentation for the updated version of JNOS. I also had a problem with ram usage. It seems that JNOS version 110L and earlier default to using EMS. My 286 doesn't have EMS, but it does have XMS. Here's what I learned. If you run this version from the DOS command line as follows, it will use only conventional memory (base 640k).

Try this:

jnos110L -m2

The -m2 forces it to use your base ram. Here's a list of the -mn commands:

-m0 forces it to use EMS (the default)
-m1 forces it to use XMS
-m2 forces it to use the 640k base ram
-m3 forces it to use the hard drive

The new version that I mentioned above, 110M, will do this automatically. It will look for EMS first, if none found it will try XMS, if none found it will try base ram.

Good luck and I hope this helps,

Scott Holland - N2BZT

Message-ID: <4g877h$85k@news.dgsys.com>
Source record: 38467

Well I have good news to report about the software and support of
MacRatt III 1.0a. I have exchanged messages with the Kevin, the
author, and find him to be very ammenable, and extremely helpful in
resolving some of the 2232, and dual port problems in the application.
There is a later version of Macratt III, V1.0b which corrects a bug in
the dual port implimintation. I have beat up on the 1.0b version now
for a few hours and It has been a pleasure to use.
The UI (User Interface) has some very interesting, and cool features
that will make those folks that have the Mailbox and Gateway modes
enabled, very happy. There is a lot more to the application than first
meets the eye, and I still haven't fooled around with the color stuff
yet. It seems that I may have been a little hasty in some of the
comments in the earlier post, but only time will tell if AEA can come
up with the support that their customers deserve. Kevin sure has done
a bangup job of supporting the application for me and I wish him great
success in any further enhancements for MacRatt III.

Rob

The opinions of some do not sit well with others. What one person
deems to be offensive maybe humorous to another. There is no standard
employed here and it is too much open to interpretation.

If you get idiots that want to sue you for propogation of messages
that they deem to be unsavourey, you need to go and visit them in the
middle of the night !!

My BBS only filters out VERY offensive words which I'm sure are
offensive internationally !!! Otherwise I import/export and do NOT
play god !!! And I do NOT read other peoples private mail is it does
NOTHING for me !!!!!

1083. NET_Mac2.3.58.sea.hqx.text

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-19 00:00:00 UTC
From: adam@iag.tno.NL
Message-ID: <199602190802.JAA07624@iag.tno.nl>
Source record: 38473

The Netherlands, February 19, 1996.
Hello dear reader,

NET/Mac v2.3.58 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Some mods for ROSE (by Joe K5JB, I forgot these mods in 2.3.47)
- 1995 -> 1996 in Copyright notice
- Mod for 'beacon set' command
- 'addmenu' mod to allow APRS beacon formats. See online HELP
- Implemented some temporary mods to keep track of sleeping sessions
- Mod by DK2HD:
Allow ^[(escape), $d (date) and $t (time) in 'param' command
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
- wa2zkd mirrors UCSD's incoming on his Landline BBS. Ham's w/o ftp
can call 716-544-1863 or 2645.

NET/Mac will be uploaded to PI1HVH.AMPR.ORG, directory public/mac.

Message-ID: <wb8ypo.19.00019FF3@harborside.com>
Source record: 38474

Hi the name is Chris and I am running F6fbb as a PBBS here. I just got the 7plus files to forward to a file but can get them to decode when all the 7plus files are there. the sorting file I am using is pick7 which looks for 7plus files and works very well. Its then that I have the problem in decodeing the files in that DIR, thanks 73 Chris wb8ypo@harborside.com

1085. Re: KAM+ or PK-232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-19 00:00:00 UTC
From: Ian Brothwell <ibx@cs.nott.ac.uk>
Message-ID: <4g9ugm$56l@griffin.ccc.nottingham.ac.uk>
Source record: 38475

The comments that I've received over here in the UK is that the KAM is better at HF (non-packet) modes and the PK-232 is better at packet.

Remember that the PK-232 can't operate both ports at once (and I understand that AEA's DSP-2232 was supposed to have this simultaneous operation built-in but actually got it sometime after launch, according to info I've received here in G-land) whereas the Kam can do this because it has two modems within it.

This difference in modem design might also mean that the Kam can operate a true 170Hz shift for RTTY whereas the PK-232 might (might - I can't remember this one 100%) use a 200Hz shift. Okay, both shifts should work but I'd personally prefer to use as close to 170Hz as I can get.

My Kam is c1987 but the manuals were certainly more than just scraps of paper; I have found them to be excellent guides to both data comms and the Kam itself. I wonder if the person who made the "scraps of paper" comment bought second-hand and didn't receive the full manual set?

One other factor in favour of the Kam is that most are user-upgradable simply by replacing the EPROM. The KamPlus can partially be implemented in the old Kam though there are limitations on RAM that prevent full implementation.

I bought a Kam second-hand; I've also had a PK-232 for review and you'd certainly notice a difference in size - the PK-232 is at least twice as big as the Kam. I've heard of fellow UK hams trading in PK-232s for Kams but I've not heard of anyone going the other way.

CI can't comment about the PK-900 because I've not used one - have you considered what that has to offer?

Hoka software in Holland *might* be able to offer something suitable.
They do decoding software that handles a great many modes but I don't have a
list in front of me at present. I don't know if they are represented in the
USA.

Hi Ken,

Mine was one of the ones locked up in amtor acks. Kantronics said it was the
buffer overflow you mention above. I reset some values and never had the
problem again in any of our subsequent tests. I am running ver 7.1 of the
firmware.

>am considering commercial stuff as well.

Getting over the mountains is a problem. The 9600 baud and faster gear
is intended for operation at VHF/UHF, and that's mostly line of sight.
If you can put relay stations on a couple of the mountains, you can make
it work. But if you can't do that, your better choice will be to use
the lower end of HF using a technique called NVIS (Near Vertical Incidence
Skywave). Basically you use antennas that fire almost straight up. The
signal bounces off the ionosphere and comes back almost straight down.
This gets you good coverage out to a hundred miles or so, and avoids
the problem of obstacles like mountains. The problem with this approach
is that speeds as fast as 9600 baud aren't really practical at lower
HF due to multipath smearing of the symbols. Real throughput is limited
to about 750 bps with available equipment. That's better than nothing,
however. In theory, more elaborate modulation schemes can give better
throughput than that, but in the amateur bands we have regulations that
don't let us use those techniques. A commercial fixed service license
would be required to use those better techniques.

>Please let me know about manufacturers and dealers in Europe (the closest to
>Bulgaria the better -- l don't think l could afford airmailing such gear)

I'll let our European colleagues comment on dealers and prices over
there. Here, we can put together a good 9600 baud UHF station for
about $300. A low end NVIS HF station might run close to $1000. (Of
course you *can* spend more, but you don't have to.)

KAM+ gets my vote also. I have owned both. In addition to the reasons stated above, the KAM+ has enough audio drive to allow me to use the 9600 baud packet jack on the back of my radio and not have to mess with the mic cord. It also allows you to operate with an open squelch by setting CD to 'software'. I have been able to pick up weaker signals this way than when using squelch control.

I would like to know from those who have used the KAM to receive WEFAX (and SSTV I hope), how the scheme works. The manual fro the KAM skims the topic and leaves the user (me specifically in limbo :)).

Specific questions I have include...

1. What kind of software can I use and where can I get it?
2. Will JVFax work?
3. It it even a feasible proposition...I've been told that one cannot copy greyscale using the KAM

I also need and elmer who will help me get setup.

Another possibility is the CP-290 X10 interface. It connects between a Mac serial port and the power line to control up to 8 X-10 modules, including relay modules. The software it comes with is pretty dated, but I saw that is still being sold by:

This statement seems to suggest that the modem in the KPC-3 can be
upgraded to 9600 baud operation, though possibly not easily. From
a look at the KPC-3 diagram, it was clear that the KPC-3 was built
for 1200 baud operation *only*, and does not offer a 300 baud
option. Furthermore, the HDLC interface is implemented in software
and, to the best of my knowledge, will not run at 9600 baud, even
if an external modem was connected in place of the internal 1200
baud modem.

Greetings. I'm thinking about taking over the local BBS in the Kitchener, Ontario area and would like some input from anyone running FBB under OS/2. The machine is a 486 2/66 with 16 megs of ram running Warp Connect.

Is there comparable software *native* to OS/2? I do have Win/OS2 so Windows software is a possibility as well (although all the software I run is native OS/2 other than TPK).

Memory settings would be a great help, as well as any info on running BPQ.

Any help would be appriciated.

Earlier in the year, I posted that a KPC-3 could not be upgraded to 9600
(exactly because of what you cite above Dana). I was quickly "corrected"
by a person (cant find the message right now, but Im still looking) that
claimed in fact not only could it be done, but that they had done it, hence,
the reason for my terminalogy above.

All I can remember, is it was a name that could have been either a males, or
females, but none the less, thanks for the clarification Dana.

Take care.

1101. MFJ 1278 to Kenwood 690 - HELP making Connection

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-20 00:00:00 UTC
From: Rick Johnson <rick@halls.com>
Message-ID: <312A84FE.47B2@halls.com>
Source record: 38402

I am having trouble correctly connecting the Kenwood Acceccory plug to
the 1278B. If there is someone who can help me verify the pin-outs
and initial check out / start-up, I would be grateful.
Please email to : rick@halls.com ...
Are there any secrets to getting the most out of the 1278B ??
Thank you in advance.
Rick N8HUJ

1104. Help BPQ & CHAT PROGRAM

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-20 00:00:00 UTC
From: cm4bcatp@bs47c.staffs.ac.uk
Message-ID: <4gc5ja$3u8@bs33n.staffs.ac.uk>
Source record: 38405

Hi All

Im trying to get CHAT4 working with my BPQ in windows.

How do you set up a callsign so as the node knows what to connect to?
I mean setting up a callsign in the chat program.

1106. Mac Ham Users Group

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-20 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-2002960521430001@wd1v.mv.com>
Source record: 38487

"Macnet Roster" (ver. 733) has just been updated and is now a stand-alone application! The version number = the number of hams using Macs.

"Macnet Roster" lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster":

Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

Or connect to my home page via the WWW

http://www.mv.com/ipusers/wd1v

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

Hello ALL

I am running an FBB system v515c, bpq4.06 and a single mfj1278 in kiss mode.

Problem is that the TNC goes BESERK every two days and totally screws up !!. It looses its baud rate and is very difficult to reset..

Does ANYONE have any ideas ????

>thanks Frank WD6AGS

I haven't used one, but, looking at the design, I'm fairly certain
the receiver would work OK (using the discriminator output, of course)
but the transmitter PLL would suppress the low frequency component of the
signal, more than likely resulting in a poor BER.

I know of Two different programs for what you want, there maybe
more. There is a program called Weather Man to pick up WEFAX, then there
is a program called Color Slow Scan Tv for Blaster, for the SSTV. I have
them both. If you would like more info I can give you more details.

Message-ID: <les-2002961104280001@lesmac.rfx.com>
Source record: 38495

I am considering making a differential signal decoder for GPS.
The US coast guard transmits a correction signal at about 300 Khz
and the correction data is MSK modulated on it at 100 baud.
I believe the data once recovered has some simple error correction
and is then fed to the Differential ready GPS through RS232.

Considering the slow speed , is there an easy MSK demod circuit around?
Maybe using an AtoD converter and singal processing it ? After all , it's
only 100 baud....

>
>Kantronics KPC-3,

Great little TNC. However, its not a TAPR clone, hence, the modem portion can not be upgraded easily. This TNC has the smallest foot print, and will run on a user installed 9vdc battery and wire clip. (which is VERY nice for portable packet from a laptop and/or field day) This TNC also supports voltage from 7vdc to 16vdc.

>AEA PK12

Nice, but my last pick of the 3. Configuration loading and setup are more of a hassle on this one, but once set right, will preform well. This TNC requires 12vdc, but I have ran run from the car at 13.8vdc, and didnt seem to hurt it any.

>MFJ-1270C

Good TNC. Best 300 HF preformer of the group, and the audio tone is the best. The MFJ is ma TAPR clone, hence, the modem can be upgraded to 9600 without much problem. This TNC runs fine from 10vdc to 14vdc.

IMHO, I would choose the MFJ for a home station stand alone TNC. If you have visions of useing it in the field, car, ect., I would pick the KPC-3 because of its versitility.

Take care.

FRIENDS,

If you would like a free copy of a radio database program that covers longwave, mediumwave, and shortwave with at least 4,000 of records, send your NAME, POSTAL ADDRESS, and EMAIL address to chuck@flinet, and I will return the program to you via EMAIL.

The program is not up to date! It is a program used during 1994 and hasn't be updated since. However, many of the records are still current for stations that do not change every quarter.

The program is good until June 6, 1996. After that it will not function.

Hope to hear from you and don't forget your Postal Address for registration and future information via mail..

All addresses will be kept confidential!

Chuck

1119. data radio information please!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-21 00:00:00 UTC
From: kotto@comp.uark.edu
Message-ID: <4ge2ac$2ge@wizard.uark.edu>
Source record: 38409

Hi!
I just got my license today, and I need information, and lots of it.
Maybe there's a big ol' FAQ out there for me? Well, here are some
specific questions:

1) I visited a local ham who highly recommended a KAM Plus. Its speed is
1200/9600 baud at VHF/UHF/HF, right? Will it REALLY transfer at 9600,
or will the actual throughput be more like 2400 baud?
2) Isn't 1200 baud the max allowed speed for HF bands? If that is the
case, then I will NOT want to spend the extra bucks for a TNC like the
KAM Plus to handle HF, because I want a TNC to transfer data, not to
type to somebody. So if this is true, what TNC would you guys
recommend, where to get it from, and what is the price?
3) I saw somewhere on the net last night that a special transciever is
required to transfer data above 1200 baud. Is this true, and if so,
what 2m HTs would you guys recommend? Another question here is, how
does a TNC attach to an HT?
4) Are there any TNCs above 9600 baud for sale, and are they very
reliable?
5) (you'll love this one) Is there a possible way to use TNCs to play
games like Doom and Descent? The local ham could not describe how a
TNC functions well enough for me to understand. If I'm lucky and a
TNC communicates like a modem or null modem, then great. Or could I
possibly make a TSR to connect the two TNCs and then could use them
like modems or null modems?

Thanks for your time. If you can, I would love for replies to be e-mailed to
me in addition to being posted here, because I don't get on the net too much,
and when I do, some newsgroup posts are usually gone.

Kevin

Yeeeees!

I would like more information on this and the software.

I have been told that not all soundblaster cards will work. Is this true?

Thank You

Source record: 38415
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I mentioned Hoka software in an earlier posting.
I now have their UK details to hand. Hoka Software is available via

NTech Communications,
8 The Crescent,
Willingdon,
East Sussex,
ENGLAND
BN20 9RN

email - 100612.725@compuserve.com
Web - http://ourworld.compppuserve.com/homepages/HokaElectronics

I've NO connection with either Hoka or NTech other than having seen the advert
in the UK based publication "Short Wave Magazine".

Hi there, I am looking for IF/RF detectors/detector diodes for micropower measurements (100 MHz - 2 GHz). Has anybody had any good or bad experiences whith this products ? Has anybody know manufactures which produce such parts.
Thanx in advance for any help.
N. Alexander

: Hi,

: Does anyone knows what is the Latest version of HAMCOM program,and what
: are the new features it includes ?
: I have the Ver.2.1 and I built the Modem (actually the Comporator) and
: use it on RTTY but the performance was not very good ,I could only detect
: the Strong signals.On the other Hand the modem is working fine with
: the JVFAX program for SSTV (Great program !!!).
: Any Ideas about how to improve the RTTY reception with the HAMCOM ??

: Best 73's

: Samir (OD5SK / KC5RYL)

Version 3.0 is available via ftp from garbo.uwasa.fi as HAMCOM30.ZIP

I have tried this with a simple comparator circuit and it works
brilliantly on RTTY - only really tried it on the amateur bands, 170Hz
shift, 45 baud but it is excellent.

Use a faster op-amp than a 741 - the 3140 I use is OK.

The receiver is a TS940 with a 500Hz IF filter and it certainly does
help having that extra selectivity. The tuning aids on version 3.0 are
also excellent.

Note that version 3.0 is NOT freeware but shareware.

Maybe there is an even later version????

Give it a try!

> or will the actual throughput be more like 2400 baud?

You're limited to 300baud on the HF bands.

Throughput for a 9600baud modem over RF is going to be noticibly slower
than an equivalent land-line modem, primarily because you'll be using
a simplex link, and you have to deal with PLL lock times, etc.

>2) Isn't 1200 baud the max allowed speed for HF bands? If that is the
> case, then I will NOT want to spend the extra bucks for a TNC like the
> KAM Plus to handle HF, because I want a TNC to transfer data, not to
> type to somebody. So if this is true, what TNC would you guys
> recommend, where to get it from, and what is the price?

Well that depends - if you ever plan on using HF data modes, at any
speed, you'll need either a multi-mode or a homebrew modem of some sort.
There is actually a fairly popular software packages called "Hamcomm"
that uses a VERY simple modem you can build in 15 minutes, that will
allow you to do RTTY and AMTOR on HF. The software costs about $20.00.
Of course, the higher-level protocols like Pactor and Clover provide
much better throughput, which brings you back to a multi-mode again. :-)

For VHF+, just about any of the commercial TNC's will do, and you can
get one for under $100.00. You typically have to pay a few bucks more
for a 9600baud modem. Of course, it will also depend on what people
in your area are using - you can get a 56K modem, if you want, but it doesn't
do much good if nobody else has one. :-) But then again, it might
be a good incentive to help build a real network backbone.

>3) I saw somewhere on the net last night that a special transciever is
> required to transfer data above 1200 baud. Is this true, and if so,
> what 2m HTs would you guys recommend? Another question here is, how
> does a TNC attach to an HT?

1200baud modems can typically be connected directly to the mike/speaker
jacks on the xcvr. 9600bps and higher usually requires a bit of
surgery, since you'll need to tap the discriminator. There are 9600bps-ready
rigs available, but they vary in their actual effectiveness. There was

a very interesting article in QST last year that compared a bunch of rigs,
and that found that some of the 9600bps-ready rigs were more ready than
others. :-)

If you're really interested in high-speed networking, you'll typically
be better off with a crystal-controlled radio. They tend to have
much better recovery times than PLL rigs. The Tekk line, for example,
is very popular.

>4) Are there any TNCs above 9600 baud for sale, and are they very
> reliable?

Yes - Paccomm, in Tampa, FL. has recently licenced a 56K data modem
that appears to work well. And it's relatively cheap, too. You will,
however, need to buy/build a transverter for whatever bands you're
interested in.

>5) (you'll love this one) Is there a possible way to use TNCs to play

> TNC communicates like a modem or null modem, then great. Or could I
> possibly make a TSR to connect the two TNCs and then could use them
> like modems or null modems?

It's possible - the TNC is just another serial device, after all. :-)
I suspect you'd need to build your own driver for the higher speed
non-TNC modems, but hey, this service is for experimentation, right? ;-)

1131. HF packet. Worth getting set up?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-21 00:00:00 UTC

My employer, and I'm sure others, make detector diodes intended for use at zero bias. There is a pretty good article about them in the December, 1995, "Hewlett Packard Journal." If you would be happy with an SOT-23 package, the HSMS-2850 might be worth looking at. At low power levels, the output into the proper load is nearly linear in voltage versus input power; that diode has about 100mV/uW sensitivity in the frequency range you are interested in. You should be able to measure down to nanowatt levels with homebrew stuff; that's a fraction of a millivolt of RF.

>etc...). Anybody know of a source that still has stock of these things?

>We're so far behind the cutting edge, we're now using obsolete modem
>devices... sigh.

When you can't get the chips, the alternatives are:

- use lower-integration components. do the 2206/2211 still exist?
- use another modem standard, presumably more spectrum-efficient

I think the demise of the 3105 is a good reason to make your local users
move to something faster...

From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <312D0B64.5804@lanl.gov>
Source record: 38350

Heh, your experience is not at ALL unusual. HF packet is so crowded it is very difficult to decode many packets at all. Some tips if you MUST continue trying HF packet:
Set your GarbageMode on, so it will show incomplete packets.
Use only a good stable late model radio, the slightest drift will render packets undecipherable.
It is much easier to QSO with someone on packet using the unproto mode, i.e. you don't connect to the other station at all, just send the sentence or line unconnected. With your garbagemode enabled you can at least carry on a semblance of a QSO with someone. The "perfect packet or reject-it-all" methodology of packet "connections" is OK only if you are trying to send a program or perfect error-free copy and you can setup the connection and walk away and do something useful while your TNC fights hopelessly on, trying to get it through. This works quite well on VHF with relatively noise-free paths but is an almost useless way of growing old on HF.
Use the less popular frequencies if possible, such as 28.160, 28.170, 28.180, etc... when the band is open good the lack of 20 meter QRM will greatly improve the performance.
If you must stick to HF I recommend switching to RTTY or AMTOR, the modes are much more usable with HF propagation.

I think the Tigertronics Baypac modem with BAYCOM software or the SofTNC software is the most bounce for the buck and best performance for 1200 baud (still the most used) packet. Ramsey also sells this same unit and software for about 50 bucks brand new. This assumes you have an IBM-compatible PC of some sort. If by some odd chance you have a working Commodore 64 or 128 contact me and I can help you get even better software-based TNC systems up and running. Similar software and inexpensive modems exist for the Mac too.

1145. open forum for packet users

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-22 00:00:00 UTC
From: orrin@stinger.redshift.com
Message-ID: <4ggcmr$dnb@wing.redshift.com>
Source record: 38429

This is to announce the creation of an open forum for packet network users who feel they have been poorly treated by sysops.

Details can be found on my Web page:

http://www.redshift.com/~orrin

Click on the link for "The Sysop Sundrome" that's Syndrome sorry.
Then at the end of that section there's a link to http://www.redshift.com/~orrin/ki6eh.html.

You may submit your horror stories to me at orrin@redshift.com, and they will appear as a Web page. Specify if you want to sign your story or be anonymous. Name names and callsigns, if you feel you can.

orrin@redshift.com

1146. using NOS for InterNet email ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-22 00:00:00 UTC
From: ecgallup@mlode.com
Message-ID: <4ggl9b$8os@news.wco.com>

I have a dial up PPP Internet account. I had been wondering if there was any DOS programs which could take the place of my Winsock/dialer and mail programs which run under windows. I just realized that NOS (I use GRI NOS at home) might likely do.

Can someone tell me if I am correct, and how would I go about configuring NOS (in general terms should do) to accomplish this. I am somewhat NOS literate my no guru in it. I do have the NOSview book. Thanks.

1148. TCM3105 Source?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-22 00:00:00 UTC
From: bm@lynx.ve3jf.ampr.org
Message-ID: <slrn4inlmk.63f.bm@lynx.ve3jf.ampr.org>
Source record: 38432

Now that TI has discontinued the TCM3105 modem chip, it seems to have quickly disappeared from the usual distribution channels (Future, Arrow, JDR, etc...). Anybody know of a source that still has stock of these things?

We're so far behind the cutting edge, we're now using obsolete modem devices... sigh.

Barry

1149. FS: RCA 500, 700 & 1000 6M and UHF Mobile Radios

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-22 00:00:00 UTC
From: mnowlen@cwi.net
Message-ID: <4ggnfe$htc@news>
Source record: 38433

FS: RCA 500/700/1000 6M and UHF Mobile Radios

Plug and Play Commercial FM Mobiles for sale.....
THESE RADIOS WOULD BE GREAT FOR FIXED FREQUENCY PACKET STATIONS!

RCA Series 1000 Low Band Mobile Radio High Split (42-50 Mhz)
FULLY SOLID-STATE 100 Watt Commercial FM Transceiver. 4 Frequency,
Crystal Controlled. Converted to 6 Meter Operation. Tuned to
52.525 MHz (Crystals are seperate, see below).
I have converted many of these radios and they work great.
CONDITION: Very Good. Fully Cheked and operational.
Accessories are seperate (see Below).
Comes with 1 set of Channel Elements.
30 lbs $75
SAME as above but minus covers 20 lbs.....$65

RCA Series 700 UHF (450-470 MHz) Mobile. 25 Watts FULLY SOLID-STATE
Commercial FM Transceiver, 4 Frequency, Crystal Controlled.
CONDITION: Very Good. Checked and Working. Accessories are
seperate (see Below). With 1 set of Channel Elements on 468 MHz.
Not Checked, SOLD AS IS.
25
lbs.....$60
SAME as above but minus covers 20
lbs.....$50

RCA 500 Low Band (42-50 MHz) Mobile. 100 Watts. Converted to 6 Meter
operation, Tuned to 52.525 MHz (Crystals are seperate, see below).
Solid State Receiver and Exciter (Same circuits as The Series 700 and
1000 radios). Tube driver and final. HAS 2 CHANNEL SCAN CAPABILITY.
THIS IS A VERY CHEAP WAY TO GET A BIG SIGNAL ON 6 METERS!
CONDITION: Very Good, Checked, Fully Operational Complete, Accessories
are
Seperate (see Below). With 1 set of Channel Elements.
25
lbs.....$50

RCA 500 UHF (450-470 MHz) Mobile. Solid State Receiver and Exciter
(Same circuits as The Series 700 and 1000 radios). Tube driver and
final.
CONDITION: Fair. Looks Complete. With 1 set of Channel Elements.
Have 2 units available. I don't know much about these. Not Checked.
SOLD AS IS!
25 lbs.....$25 ea

ACCESSORIES:
I'm selling accessories for the 500/700/1000's seperate as the supply
is
limited.
First Come, First Served!

RCA 500/700/1000 CONTROL HEAD and ACCESSOIRES, Single Channel
(can be used with any of the above), Very Good Condition Checked.
Speaker is built in to head. Microphone and Cable
Included.....$20

RCA 500/700/1000 CONTROL HEAD and ACCESSOIRES, 4 Channel,
Modified for Special System, but works with any of the above radios.
With lights for Freq 1,2,& 3, Speaker is built in to head.
Cable Included. Fair Condition, Checked,
Working.....$15

Cable, 4 Channel, Good Condition, Checked,
Working.....$5

Set of crystals for 52.525 MHz in Channel Elements calibrated for
RCA 500 or 1000 6M
radio.....$25

Extra Set of Channel Elements for any of the
above.....$5

QC Deck (CTCSS) without vibrosend/sponders,
.....$20

Replacement Speaker for Control Head, Excellent
Condition.....$5

PRICES DO NOT INCLUDE SHIPPING. Send Zip code for shipping estimate.

In article <4ge2ac$2ge@wizard.uark.edu> kotto@comp.uark.edu (Kevin Otto) writes:
>Hi!
>I just got my license today, and I need information, and lots of it.
>Maybe there's a big ol' FAQ out there for me? Well, here are some
>specific questions:
>
>1) I visited a local ham who highly recommended a KAM Plus. Its speed is
> 1200/9600 baud at VHF/UHF/HF, right? Will it REALLY transfer at 9600,
> or will the actual throughput be more like 2400 baud?

The KAM only offered 1200 baud VHF packet. I'm not sure about the KAM+,
but I don't think it comes stock with a 9600 baud modem either. I could
be wrong about this, Kantronics doesn't seem to buy much advertising for
this unit. I just searched the last several months of QST and found
Kantronics ads only for the KPC-3. The KPC-9612 is a dual speed unit
from Kantronics that offers 9600 out of the box. (Works pretty good too,
I have one.)

Throughput with a 9600 baud packet TNC will be *much* less than you're
used to seeing with a 9600 baud V32 telco modem. Packet is usually done
half-duplex, and the turnarounds, protocol overhead, etc add up to give
you an effective throughput far closer in feel to a 2400 baud telco modem
than to a 9600 baud telco modem. If you add in a digi hop or two, thoughput
gets downright glacial.

>2) Isn't 1200 baud the max allowed speed for HF bands? If that is the
> case, then I will NOT want to spend the extra bucks for a TNC like the
> KAM Plus to handle HF, because I want a TNC to transfer data, not to
> type to somebody. So if this is true, what TNC would you guys
> recommend, where to get it from, and what is the price?

1200 baud is the fastest speed allowed on HF, and then only on 10 meters.
On the rest of HF, 300 baud is the fastest speed allowed. Remember this
is also half-duplex and is much slower than the equivalent telco modem
operating nominally at the same baud. However, with symbol overloading,
higher effective bps can be achieved, but not using off the shelf packet
TNCs. AX25 packet using Bell 103 modem technology is a *horrible* thing
to try to push over an HF channel. Don't waste your time on it. If you
want to use HF, switch to PACTOR, GTOR, or Clover II. Those systems were
designed with HF in mind and work *much* better, especially Clover II.

>3) I saw somewhere on the net last night that a special transciever is
> required to transfer data above 1200 baud. Is this true, and if so,
> what 2m HTs would you guys recommend? Another question here is, how
> does a TNC attach to an HT?

A HT is a *horrible* choice for packet. And as far as I know, *none*
of the current crop of HTs can be made to work at 9600 baud. Most HTs
will work at 1200 baud, but they are still a bad choice due to the fact
that they aren't very good as *radios*, suffering low output power,
poor IMD performance when used on an external antenna, and often slow
turnaround times too.

To avoid becoming a hidden terminal, you need to be able to put out
a good signal that will cover the MAN (Metropolitan Area Network) in
which you are operating. That means a decent amount of power and a
good external antenna. Hidden terminals are very harmful to total MAN
performance, IE *your* throughput may not be adversely affected, but
everyone else's will be due to the collisions caused by a hidden
terminal on the MAN. An exception to this general rule is when the
MAN is served by a digital repeater (not a digipeater). Then the HT
won't pose a hidden terminal problem, but it will still suffer from
IMD and slow turnaround time. Use a real radio for packet and leave
the toy hanging on your belt where it belongs.

To do 9600 baud, a transmitter needs to be true FM (not PM), and must
not inject modulation into a PLL. That eliminates most synthesized
transmitters. A crystal controlled transmitter usually works, though
some are PM, beware. And a few radios that do modulation at a fixed
IF frequency will work, mostly the so-called multimode units, IE IC-820,
IC-275, etc, but not TS-711 or TS-751. Most ordinary synthesized
transceivers won't work, or at least won't work well.

The second thing a radio needs if it is to do 9600 baud is a receive
IF filter that is phase linear across the bandpass needed for the
modulation envelope. Most transceivers don't have this either. Their
filters are too narrow, filters become very phase non-linear near their
edges, so you need wider than normal filters for 9600 baud packet in
order to keep the signal centered in the linear response region of
the filter. Of course you also need direct discriminator access so
that the audio shaping circuits won't corrupt the eye pattern.

There are a few radios that do work well for 9600 baud. The Tekk
900 series works, Kantronics and MFJ make crystal controlled data
radios that work, and as mentioned above, some multimodes work Ok
too. Azden also mades a radio, the PCS9600D, that works well. But
the Kenwood, Yaesu, Icom, Standard, Alinco, etc radios that are
advertised as 9600 baud ready *aren't*. They all have one or
more of the defects listed above, and their BER performance is
dismal.

>4) Are there any TNCs above 9600 baud for sale, and are they very
> reliable?

Not TNCs, that's the wrong paradigm for higher speed digital, but there
certainly is at least one RF modem that works very well at 56 kb. That's
the WA4DSY (aka GRAPES) modem. It's available as a kit from GRAPES, or
in a newer packaged form from PacComm. This is a *RF* modem, IE it *is*
the radio as well as the modem, which is the only practical way to do

higher speeds. It requires the addition of a transverter to kick it from 10 meters to the UHF band of your choice, and it needs a data pump to handle the PAD function. Now there are two TNCs which can be used as the PAD, the Kantronics Data Engine, or the PacComm Spirit, but that's not a good solution. A better way is to use a plugin HDLC card for your PC, such as those offered by the Ottawa Packet Group or by Gracilis. These allow direct DMA transfers to and from your computer's memory, and avoid the RS-232 bottleneck with its interrupt per character that plagues external TNC to computer communications at the higher speeds.

Performance of the WA4DSY modem is quite good. In half-duplex form, it feels subjectively like a 19.2 kb serial connection. If used full duplex (which it allows) on a non-contending channel pair, it really flies, offering the equivalent of switched-56 telco service.

>5) (you'll love this one) Is there a possible way to use TNCs to play
> games like Doom and Descent? The local ham could not describe how a
> TNC functions well enough for me to understand. If I'm lucky and a
> TNC communicates like a modem or null modem, then great. Or could I
> possibly make a TSR to connect the two TNCs and then could use them
> like modems or null modems?

TNCs aren't like dumb modems, they want to speak their protocols. Now if you are running Linux, you can do the AX25 equivalent of a PPP link over the TNC used in KISS mode with native drivers supplied with the OS, so you have full TCP/IP networking and any game that works over a TCP/IP network, such as Doom, will work fine. Trying to game using one of the Great Satan's operating systems isn't going to be as easy, ranging from nearly impossible with DOS to barely workable with Win95. You might have better luck with OS/2.

In article <4gfus2$58v@reader2.ix.netcom.com> scicon@ix.netcom.com(Dan Walker) writes:
>Is it worth getting set up to use HF packet?

I'd say generally no. Unless you're part of a traffic forwarding system, packet offers very little of utility at HF, and even for traffic forwarding, packet as currently done has some very serious problems.

>Seems like my MFJ-1270C hardly decodes any packet signals at all
>on HF. Are most people using Pactor?

PACTOR is currently the most popular HF digital mode. It works pretty well, though Clover II is much better. GTOR is up and coming, offering some advantages over PACTOR, though seriously lagging behind Clover II in performance. And PACTOR II is now becoming available. It may be better than Clover II under certain circumstances.

If you're going to setup for HF digital, get a DSP unit that has a manufacturer offering strong firmware support, and who has committed to supporting newer modes as they come along. HF digital is in a state of flux, and any non-DSP hardware you buy today is likely to be obsolete in a year or two.

I'm using the HAL P-38 card, which I believe is the most cost effective DSP approach currently available for HF digital. HAL is supposedly going to offer upgrades to the P-38 to support PACTOR II, and is also rumored to be adding GTOR support. Right now the card does RTTY (Baudot and ASCII), PACTOR, AMTOR, and of course Clover II.

PacComm sells the German PACTOR II box, but it's $995. They are supposed to come out with a less expensive US built version *real soon now*. I've seen the prototype, but the step to production may be a while yet. AEA claims in their ads that they will support newer digital modes with their new DSP box, but so far they don't support Clover II or GTOR, though they do support PACTOR. I haven't seen any indication of a DSP box out of Kantronics yet. They're a close mouthed bunch, though, and who knows what they may be working on.

10 meters is HF, and 1200 baud is allowed there. I know, big whoop.
With the sunspots as they are, 10 meters might as well be VHF. :-)

i hate to remind everyone, but digipeaters really don't work
worth a hoot. The digipeat function was an compromising kludge
from the start. It would have been better if it had never been
conceived of. Since you're in Maine, i'll bet you can find a
repeater pair on 440 or MAYbe even two-meter-CB pair. Grab one of
those and put up a full duplex packet repeater. Packet users
should stop settling for garbage performance.

> < S N I P >

Let's make just one minor correction: You CAN run 1200 baud on 10M; above 28 MHz you are not limited to just 300. However, propagation on 10 has been so bad you could probably do better using a wet string! Also I would further emphasize Rich's comment that throughput over a simplex radio connection is greatly reduced compared to a quiet full duplex telephone line:

For a VHF radio packet rule of thumb, figure that AT BEST you will see one fourth the throughput of landline modems operating at the same speed. Thus on 10M your 1200 baud packet runs about as fast a 300 baud wireline. On the lower HF bands you can probably cut that number down by another 50%. If you think 300 baud landlines are slow, HF (300 baud) packet radio averages 1/8 of that, or about 36 baud!! The more exotic modes AMTOR, PACTOR and CLOVER are faster, much faster, and very much faster respectively.

The usual disclaimer: Your thumb may be bigger. 73

Kepp in mind non-Morse data is only allow between 28.0 and 28.3MHz.
I've run 1200baud on 28.195 several times, usually into adjacent
states. Pretty cool.

1161. Re: HAMCOM LATEST VERSION ??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-22 00:00:00 UTC
From: crafty@pgh.nauticom.net
Message-ID: <Dn72Gs.D6J@pgh.nauticom.net>
Source record: 38445

As far as I know, the last release I've seen was Hamcom ver. 3.0. I have had the same experience with Hamcom on RTTY. Works ok on strong clean signals, but not very well otherwise. Seems to do a good job on CW, though. If there is a newer version, or if you find a way to improve RTTY reception, let me know.

>dismal.

OK, since the majority of the amateur type accepted radios don't do
very well at 9600, can someone recommend a commercial type accepted
radio that is easy to modify, cheap, and has good performance at
9600? I already know that the mitreks and maxar 80s work at 9600,
but how easy are they to modify?

I'm looking for a radio that will work well at around 445Mhz and with
at least 10W of power (I'd use the TEKK, but my signal is just a little
too weak to get into the repeater properly). Being a hidden transmitter
isn't a problem -- I'll be using a 9600 repeater.

regards,
Dean.

Hi all,
as soon as Roger Barker updates WinPack the new version
gets uploaded to "The Cellular BBS" +44 1604 757777 (3 lines all V.34)
you can also leave messages for roger on the BBS

the latest version is 5.40 uploaded by roger 07/02/96
all Winpack files are in file section 190
only roger can upload into this section so its allways 100%

Cheers
Paul....

> Life is what you make it....
> ==

Hello:

I am not sure on what you want to do. But if you want that users may
connect to the chat server directly (using an own callsign for the
chat server) instead of connecting to the node and then issuing the
chat command, you must recompile the chat4.pas program, following
these steps:

1) Look for the Procedure setup.

2) In this procedure, locate the following line:
regs.dl := 16; { Application number }

3) Change to
regs.dl := 1; { Application number }

4) Compile again

Then, you must change in BPQCFG.TXT the following parameters:

1) BBSCALL=GB4CHAT ; put here the callsign of the server

2) BBSALIAS=CHAT ; put here the alias of the server

3) BBS=1

4) Run BPQCFG.EXE

Note that I haven't tested it, but I hope it works for you.

Best regards from Miguel Angel, EA1DOF.

An interesting idea but legal liabilities probably will prevent
such a database. One major problem would be determining the actual
events based upon the involved parties statements. The potential for
libel suits is scary....

From: lenggen@fasnov1.zrh.sc.philips.com
Message-ID: <4gk5gk$sj9@phcoms4.seri.philips.nl>
Source record: 38360

Hi all

For a few weeks now I'm poud owner of a new PTC-II controller, which offers the new PACTOR-2 mode (a major improvement over PACTOR-1). Unfortunately the terminal software that comes with the PTC-II is a DOS program, and in my opinion its user interface leaves a lot of room for improvement.
Although the PTC controllers are not (yet) widespread outside Europe, I would like to ask here if anyone knows about a Windows program to control the PTC controller.

From: elschemm@mtu.edu
Message-ID: <4glu16$otl@tamarack.cs.mtu.edu>
Source record: 38361

I recently dug out my old Ramsey Packet Modem to use as a second TNC.
It works fine with the BAYCOM software that came with it, but I want
to use it for something else (and possibly not on a PC).

Does anyone know of any source code for the BAYCOM program, or anything
similar? I tried hooking it up and letting a generic terminal program
listen, but nothing came through. I suspect that it needs something
more.

Any help would be appreciated.

Source record: 38364

Hi,

I notice that MFJ advertises a real time clock (RTC) unit for
MFJ and other TNC-2 compatible modems. Does anyone know how this works?
Is this in fact just a Dallas DS-1216? Does this mean that TAPR and MFJ
have already included code to read these devices? Or is there some other
method or code in there that we do not already know of? If anyone has
any clue as to how this thing works I would greatly appreciate it. I am
trying to build an RTC for my MFJ but I would like to use it with the
WA8DED host mode and do not know if the MFJ unit will actually work with
the WA8DED firmware. Thanks in advance.

Source record: 38365

Hi,

I have managed to get some sources for The Firmware but do not know what compiler/assembler/linker I should use to compile this. I am trying to recompile a version of The Firmware to include support for the Dallas DS-1216 real time clock or some other real time clock. I would appreciate if anyone could furnish the information I need to compile my own version of The Firmware. From what I can make out of the makefile, they appear to be using a C compiler called QC or Q/C-Compiler and XAS as the assembler for the Z-80 code, and XLNK for the linker. Thanks.

Based on the message-ids, I presume the original poster resides in the US, which means using the Euorpean version would cause a violation of RSA/PKP's patents, whereas the US version doesn't, since it uses RSA's kit to do the public key crypto. The European version is fine for outside the US (and Canada?) because RSA/PKP didn't patent it outside the US.

You can get source code if you want it for the US version. People keep speculating that it's been doctored, and no one shows where. I would write it off as urban legend.

PGP is available from http://web.mit.edu/network/pgp/

>switching to Pactor.

Be grateful you can't decode HF packet. All you'd see while
monitoring someone's QSO would be 10 to 15 retries per 1
frame that got through. In "my" opinion, Packet, as a mode
should be relegated to VHF and above. Pactor will, in all
likeliness, be more robust on HF than Packet could ever
dream of being. The same can be said for G-Tor and Clover.
Unfortunately, many digital enthusiasts have HF Packet
capabilities and not the other 3, but that will change
as all those older PK-232's (I use one) and older KAM's
die (fat chance) and people buy new ones. I like to chase
DX, so my heart does and will forever belong to Baudot.
Oh yeah, your question...HI, Go with anything except
HF Packet.

>very well at 9600, can someone recommend a commercial type accepted
>radio that is easy to modify, cheap, and has good performance at
>9600? I already know that the mitreks and maxar 80s work at 9600,
>but how easy are they to modify?

No amateur radios are Type Accepted. Now Mitreks and Maxars, as
well as Micors, can be modified to *transmit* 9600 satisfactorily
since they are crystal controlled direct FM. However, none of them
have wide enough receive filters to give good BER performance. In
fact this is a general rule with commercial Type Accepted radios,
almost all of them have IF filtering that is too tight for 9600
baud. They weren't designed for that service, and narrow filters
help in voice use against adjacent channel interference. But
the narrow filters are phase non-linear in the bandpass of a
9600 baud signal, and that greatly increases BER, IE the eye
pattern closes down due to phase non-linearity in the filters.

At least the Maxar uses a standard 10.7 MHz IF and the ceramic filter
can easily be replaced with a wider one from Murata. The Micor uses a
non-standard IF and I expect that getting wider replacement filters for
it would be difficult (I know of no source). Unfortunately, the Maxar
is poorly shielded, and suffers greatly at a high RF site, though it's
typically Ok at a user location. However, none of these radios have
particularly good TR turnaround times (which is important to reduce
latency at 9600 baud). The Maxar is diode switched, but it powers down
the receiver strip during transmit, and receiver recovery time is long.
That's ugly for 9600 baud performance. The modifications to get rapid
receiver recovery are *not* trivial. At least with a Micor you can
wire it so the receiver strip is always hot (one of the things that
makes Micors desirable for repeater conversion).

>I'm looking for a radio that will work well at around 445Mhz and with
>at least 10W of power (I'd use the TEKK, but my signal is just a little
>too weak to get into the repeater properly). Being a hidden transmitter
>isn't a problem -- I'll be using a 9600 repeater.

The Kantronics D4-10 would seem to fill the bill. It is 10 watts, and
it is designed to be a 9600 baud data radio, so it has wide enough
filters for good BER performance. (Note, in the commercial realm, Boeing
contracted with RCA to have a bunch of TAC-700s modified for data use
(wider filters etc). If you can find one of those (Alanet uses a bunch
of them), it will also work, but the old RCAs tended to be deaf as posts,

so unless you can live with needing 2 uV for 12 db SINAD, a preamp is almost a must. Repair parts are a bear to find too.)

Since a 10 watt radio is only 7 db stronger than a 2 watt radio, a beam would seem the logical way to increase signal strength for a user station with a TEKK in a MAN using a digital repeater. A 7 db gain beam at 70 cm is rather small (and helps on receive too). The TEKK is small too, and could be mast mounted at the antenna to reduce feedline loss. I use the TEKK followed by a surplus 50 watt Motorola brick amplifier intended to be used with one of their HTs in a car. It switches fast enough to not add any significant latency. I expect some amateur bricks would serve as well, but I already had the Moto brick. This is for a simplex MAN where hidden terminals are a concern, so I'm forced to use an omni antenna.

Summary: you can modify most crystal controlled commercial gear to *transmit* 9600 baud fairly easily (though GEs require greater mods due to being PM, IE you have to introduce the modulation into the Channel Guard port and modify the Icom to get enough deviation), but most of that gear won't *receive* 9600 baud very well due to too tight IF filtering in their receivers. In other words, one of the things that makes them work well in commercial voice service is the thing that hurts them most in data service.

>should I look at others?

Lots of people *hate* AEA's software, though you can run the units from
an ordinary terminal program.

>AEA is also bring out a DSP (Digital Signal Processing) version of the
PK-232...considering
>I have a Kenwood TS-870S with DSP, would this new model be worth waiting for?

The DSP filtering in your radio and the DSP *demodulator* in the modem are
two very different things. In general, DSP demodulation is definitely
worth it (but that assumes the DSP is competently done, which isn't an
a priori given with a new piece of gear). Now if you were talking about
MFJ's new offering, where the DSP is just a bandpass filter in front of
the hardware demodulator, then the answer would be that you don't need
it because your radio already supplies it. That's different. A properly
implemented DSP demodulator can give nearly ideal demodulation, something
very hard to do in hardware. The demodulator can also adapt its characteristic
depending on the type of signal being demodulated, so DSP is particularly
useful for a multimode unit.

Nobody knows yet if AEA did it right in their new unit. If they did,
it may be worth the wait. But you can get a P-38 from HAL today, or
the German PACTOR II DSP box (from PacComm), or the TAPR DSP-93, etc.
I think non-DSP demodulators will be virtually obsolete for HF in a
couple of years, or at least relegated to low end uses. I also expect
to see new modulations and protocols appear and gain wide support in
the next few years. A DSP unit from a manufacturer committed to keeping
it current with methods in use will be important. HAL has made that
commitment, and AEA says they will in their ads. Of course an open
architecture like the DSP-93 means you can write your own code if
need be.

Buying a hardware based controller now may be like buying a 1200 baud
telco modem, IE it may be suitable for little more than acting as a
paperweight in short order as newer DSP designs quickly obsolete it.

>advantage in the PK-900 for the extra money.

The PK-232MBX is a very nice unit for the money. The PK-900 is a nice
toy, but your right, it's really not worth the extra money. The
PK-232MBX is more TNC than you'll probably ever use. I have two of
them and have gotten a lot of use out them.

>Also, it AEA's software the best, or should I look at others?

You should never limit yourself to looking at one company's software.
AEA's software is nice, but there might be features that you won't
like. I've tried their software, but went with somebody elses in the
long run. Don't be afraid to try all that you can.

>AEA is also bring out a DSP (Digital Signal Processing) version of the
PK-232...considering
>I have a Kenwood TS-870S with DSP, would this new model be worth waiting for?

I guess it counts on how long the wait is. Also, I never buy a new
product (or new version of one) until it's been out for a while and I
hear the owners complaints or praises. If you want a good TNC right
away, go with the PK-232MBX. If not, wait and see what the new one is
like.

The KPC-3 Manual Addendum (Ver 5.1 EPROM Upgrade) shows the PBForward command will cause your PBBS to attempt to initiate a forward of any eligible mail to another BBS system peridocally. Any message in your PBBS which contains an @BBS field and is not being HELD(H) or has not previously been FORWARDED(F) is eligible for forwarding. If the keyward EVERY is used, the PBBS will attempt to forward once every n hours. If you specify the keyword AFTER, the PBBS will attempt to forward whenever a user disconnects from the PBBS, and every n hours after that. Setting the time interval will cause the PBBS to attempt to forward immediately.

After the PBBS has initiated a forward, it will also request a reverse forward if PBREVERS is ON. Note that full-service BBS systems must be configured to allow your station to reverse forward mail to you. Note: Your PBBS will not forward or reverse forward unless HTEXT is set.

Hi ...

Worked great with a Paccom TNC. I have used a Baycom although the external TNC was as big and MUCH more functional. I use a little terminal program called MSYST which is bundled with the MSYS software. It works great.

I also run a full MSYS BBS on my HP100LX. Netnode, K-Node, TCP/IP, etc. and that works great.

I used it for about 2 days. It was a good program, but it was to hard to evaluate with the limited use the programmer gives you. I was thinking of getting a reg code for it till I saw the
reg fee! I thought it would be around 30$ tops, but I saw it was 79$, then removed it from my
system.

1209. Siskin connections database?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-25 00:00:00 UTC
From: bob.miles@zetnet.co.uk
Message-ID: <4gqrc4$mlr@irk.zetnet.co.uk>
Source record: 38255

Having seen the advert in RADCOM that SISKINS have a database for TNC-RIG connections, I logged on to their WWW page but cannot find said database!

Anyone had any better luck?

Am I missing something or wot!

Bob
GM4CAQ

PS I need the connections for the Thor 2 port PC TNC card if anyone knows it. Also what interface for operating the PTT line?

>if it had the BPQ hooks that would be all the better...

Hell. What a waste. JNOS already has a BBS. Why not get off the
1985 BBS circuit and into the 1990 circuit - TCP/IP. How many people
really read those boring BBS systems anymore? Everything is WW
and never of any value. It's time you dragged your users into the IP
way of doing things. It's really sad to see someone waste their time
trying to cram megabytes of bullshit into a machine, and then try to
squeeze it through a NetRom circuit (another obsolete circuit).

Here's the right way:

1. Throw away ROSE.
2. Throw away NetRom
3. Throw away BBS
4. Get an X-1 chip and set it up for TCP/IP, turn off NetRom.
5. Get JNOS and run it to your TNC. (9600 or greater).
5a. Get Linux up and running, and run JNOS on it.

Don't use TNOS, it's 1985 technology, and going backwards.
Try Kernel AX.25, but it's pretty damn buggy.

Message-ID: <313162FF.504F@ucr.campus.mci.net>
Source record: 38257

I have had both the AEA PK-232 and the Kam. I prfer the Kam as it is state of the art, runs cooler and has the selectable switch cap filtering. It has worked flawlessly on all modes. The only thing that I wish it had is the ability to be upgraded to 9600 baud packet. I sold my 232 after retrofiting it with about everything that T.A.P.R. has to offer including a 9600 baud upgrade kit. The DCD State machine is in the Kam and not in the 232. This lets you run with the squeltch open and deciphers noise for data. I saw a Kam+ in the swap area of this group for $200.00. Take care, Bob.... Sun evening 11:00pm

1212. info on Tandy 600 laptop

Newsgroup: rec.radio.amateur.digital.misc

>73 and Thanks,
>Don Middleton VE7IMD

Hi Don,

There is NO newer version of the PMP software then the version you
have (1.1) to my knowlege. The EZpaket software is at version 1.7
(me thinks) and will work with both the PMP and Baycom modem.
However, I also believe that BAYCOM modems may require a certain
mod to add the CARRIER DETECT out of your modem chip back to
the interface, whether your using the COM or LPT ports. The PMP
modems provided this CD signal to the parallel port interface. The
BAYCOM modem doesn't use it, they used a software DCD approach.
Therefore, you must ADD (via transistors or an inverter chip) the
wiring to use the BAYCOM modem with the PMP/EZPACKET
software.

The EZPACKET software was written by a high school student
at the time, FRANK DOMINA-N9MXT, for a school class. We
communicated for a short period of time when he released his
program to the world, and I found some bugs in it. I am not sure
if his stuff can be found on the WEB but any ham BBS would have
it (e.g.DIGITAL HAMSHACK in GERMANTOWN, WI). It is OK
software for ease of use.

However, I would suggest you simply modify your present PMP
parallel port modem to work on your SERIAL PORT by adding]
a few more components, and thus convert it into a BAYCOM unit!
You will have a LOT more software avenues to choose from that
way, The FBB and NPF programs give you full forwarding node/BBS
and of course JNOS can be done easily with the BAYCOM's.

I use to put out (on packet) the PMP NEWSLETTER (from 1991 thru
1995) and we discussed a lot of stuff along these lines. I am looking

for a WWW home for this old stuff as well as a place to upload the old software I have received for anybody that wants it. If you know of a good home for these old newsletters, let me know.

If you really need EZPACKET software, I can mail it to you as ZIP attachment. Take care and 73's.....

>
>You didn't mention what software you prefered...?
>
>Thanks again, Bill Crocker

The software choice also depends on what operating system you are going
to use! If you are going to multi-task and are using OS/2, you might
note that the Free ware THS-OS/2 from Peter works very well on the
PK232 and also the PK900 if you don't let it attempt to re-init the unit
on call up.

AEA's code does NOT work very well in OS/2 VDM sessions when used with
more than one comm session on the box at the same time. It works better,
at least it did for me, in DesqView, than it does under OS/2.

I was told that one of the commercial TNC programs for the AEA line, other
than their code also works well in OS/2 VDM sessions. Haven't had time
to buy it and try it yet.

I use the PK900 and am very pleased with it. I also have the PK96 and
a PCB88 in other locations and all of them work well for what they were
installed to do.

Try checking the wiring on the tnc-to-radio mike plug(at the radio)
take off the cover of the 8 pin connector and see if any wires have
worked themselves loose! I have had this happen to me two times in
about a year.
Also check your drive level out from your radio etc...

>I'm using ethernetcars in both 286-systems.

>At this time I can only use the tcp/ip functions.

SLIP is not something you use over Ethernet. IP packets are sent
directly in ethernet frames.

You should load a packet driver for the cards you use, and attach
it using "attach packet". That will setup an IP connection between
the systems. (same thing as a SLIP link would do on async ports)
Of course you also need to setup the routing.

From: Jeff Goebel <jgoebel@rrnet.com>
Message-ID: <4gr0j2$3vr@news.rrnet.com>
Source record: 38262

I did a stupid thing and deleted my Command.com for Dos 3.1 from the root
directory and then shut the computer off. (I was trying to upgrade the
Dos version on and old 8088 machine.) I only have a startup disk for Dos
2.0 and it won't give me access to the 2 20meg hard drives on the machine
so I can get things going again.

Can anyone tell me how to do this or can anyone send me a copy of
Command.com for Dos 3.10 so I can get started again? I do have the rest
of the Dos on my hard drive I just can't get at it. The computer is a IBM
5150.

Thanks

You might find some info at http://www.baycom.de/index.html but I
don't think the source code is available. PacComm is the US
distributer I believe.
Baycom modems will run in NOS programs if support is compiled in.
The JNOS versions I'm familiar with have baycom drivers.
Also I think the SP program works with baycom modems.

1225. Help with BPQ under WIN96

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-26 00:00:00 UTC
From: p.illmayer@sno.mts.dec.com
Message-ID: <4grg09$i6q@funlwb2.stl.dec.com>
Source record: 38265

Hello ALL

I have a problem with BPQ under WIN95....
P.S I use BPQ v4.08

If I setup an async port under BPQ and then start win95, everything works OK..I can then run winpac 5.4 and it works fine, out of the serial port. I connect this directly to my FBB system and all is ok.

Now, my problem is that I want to run it via ethernet.. My sequence of events are as follows

1) Boot WIN95 machine
2) Break out of BOOT and goto DOS
3) Load LSL.com
4) Load ce2ODI.exe - XIRCOM Credit card adaptor
5) Goto BPQ directory and run odidrv 200

I test this process by loading the switch program and it works great.. Now the fun starts !!!

1) I now type in WIN and I do NOT get the BPQ message.
2) I start Winpack, it DOESN'T complain that the BPQAPI driver isn't loaded.
3) I try a manual connect and there is NO activity on the ethernet..

When I type in "WIN", after 5 seconds the adaptor beeps, telling me that the card is being initialised. I think that is part of my problem, but the other odd thing is that the BPQ message doesn't come up when using an external driver..

Does anyone have any ideas.. I am using the driver supplied by the card vendor.. Is there an issue here with real mode drivers ???

I know you MUST load the BPQ switch in dos before windows comes up as per the Winpack v5.4 doco. This appears to be a catch 22 as the win startup re-initialises the card....

Thanks for your help !!!!!

1226. Packet connections for Radio Shack HTX-202

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-26 00:00:00 UTC
From: socci@bns101.bng.ge.COM
Message-ID: <9602261119.AA03498@bns101.bng.ge.com>
Source record: 38266

I am interested in connecting my Radio Shack HTX-202 handheld radio to a
Kantronics Data Engine for packet communication. The documentation for
the data engine shows pinouts for the Tx, Rx, and PTT (as well as grounds, etc)
My Radio Shack documentation says nothing about how to hook these up to the
mic and speaker connections. I don't even know if the phono plugs are
2-conductor or 3-conductor. I want to rig up a cable to connect the radio to
the data engine, but I can't find the pinouts.
I brought the radio to Radio Shack, but they had no idea. They even tried
to sell my a mic/speaker mobile handset (as if I needed it).
Has anyone ever connected a Radio Shack HTX-202 to a packet TNC? If so, what
are the pinouts?

>(I would love to see a Linux version.)

1. It is not a host mode program. It's like YAPP.
2. 79 dollars is way too high. Maybe 30 tops.
3. It's better than YAPP, not as good as host mode programs.

I agree. He needs to spend more time with X-Windows and Linux,
and less time with Windows :-)

Well you're in the DOS mode, it should work.

When I see LSL being loaded, I have to ask why? Have you tried the
Microsoft IPX/SPX protocol? Why not bring up windows and then
enable the network parts? Check for a Xircom driver there. As old as
that is, there should be a driver.

My real answer would be to chuck BPQ and run IP...

Wrong here Steve - KaWin IS a host mode program...YAPP is not.

Software is very personal, some really like KaWin, others prefer different. Personally, I use about 5 different programs, including KaWin, KaGold, Host Master, YAPP, Procomm Plus, and GMON. They all serve a purpose that the others don't.

1232. Problem TNC2 -> Terminal ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-26 00:00:00 UTC
From: pake@lin.foa.se
Message-ID: <pake-2602961427590001@pake.lin.foa.se>
Source record: 38272

I have bought an old TAPR TNC2 which I am trying to connect to my old
7-bit ASCII terminal.
But I have problems when monitoring the channel. The terminal get just crazy.
Version 1.1.6 and 1.1.8 of firmware are tested.
The problem is that I cant reject the controlcharacters and characters 127($7F)
and up with command MFILTER. I can only exclude 4 control characters.

AEA PK-232 has a special command in MFILTER $80 which filters all characters
above $7F and all control-char. except carriage-return($0D), linefeed($0A) and
TAB($09). This works fine with my old terminal.

Are there any version of firmware for TNC2 wich have this special MFILTER-comm.?
Who has a solution to my problem ?

/Per-Ake SM5BGO

Vince.

You can find the wiring diagrams for the HTX-202 at:

http://www.idir.net/~medcalf/ztx/wire/

They HTX-202 is the same wiring as the Yaesu HT shown in your Kantronics TNC
manual.

>
>So boot up with a floppy and type undelete (if you have that).

3.1 did not support the "undelete" command. Even if you boot with
a 6.x floppy, I believe the FAT table does not "mirror" a previous
change.

>>Can anyone tell me how to do this or can anyone send me a copy
>>of
>>Command.com for Dos 3.10 so I can get started again?
>
>It's copyright. Call IBM.

It is indeed copyrighted, but if you are a licensed user, you are allowed
to make a back up, and use it for yourself only.

>WHy not just buy DOS 6.22?

Because 6.22 is 6 meg...3.1 is less than 1. You can see why if you have
a 10 meg hard drive. :)

Take care all.

Help

I just got a new MFJ-1276 TNC and am trying to get it to do
PACTOR. I have it hooked up OK because I can do regular HF packet but
when I type PACTOR at the cmd: prompt I get nothing. The TNC will echo
everything you type but it never gives the p_cmd: prompt. The only way
to continue is to power off and back on. What gives?

Dennis

I am using VPTSR which is a TSR program that John Montalbano (the author of the ViewPort VGA) wrote to mate the ViewPort to the JVFAX software, and it works great. Be advised tho that JVFAX is a DOS program, not Windows. Let me know if you want it and I can attempt to attach it to a E-Mail, or sent it out via snail mail.

1238. TheNet X-1J4 to Serial Port?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-26 00:00:00 UTC
From: Carl Estey <cestey@HBC.Honeywell.com>
Message-ID: <3131C629.71DA@HBC.Honeywell.com>
Source record: 38278

I have operated a 'RLI PBBS with 6 ports using 'BPQ for many years. With a change in interest here, I have replaced the 'BPQ with TheNet X-1J in each of the TNCs (PacComm TINY-2s) and tied them together with the PacComm CoaxLAN adapter. Now I am considering how to tie a BBS (or my NOS box) into the CoaxLAN. Word is that the PacComm device intended to do this is not yet available. Does anyone have suggestions on how to do this?

1241. Help reach repressed NE tcpipers!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-26 00:00:00 UTC
From: ka1jy@usa.nai.net
Message-ID: <3131d8c0.14549819@a3bsrv.nai.net>
Source record: 38281

The ip-ip internet gateway at gw.w1mx.ampr.org has been turned OFF in a (near) brilliant political/religious power-play!

As I understand it, initially the gate was off due to some radio hardware failure. Pity. No one in my area (Ct.) knew anything about it. Next time there is a problem like this, I'd hope more folks would hear about it. There are many sources for RF gear and MANY willing donors if the word just gets around. Please make some noise if your corner of the network is failing!

This is a minor concern however as the radio has already been replaced. Even still you will notice that no traffic is moving from other amprnet groups into the Emass/R.I./N.H. area previously served by the gate.

The reason? The newly self-appointed government of the N.E.amprnet has requested that the gateway not return to the air until THEY can determine how it should function.

Phew! Just when you thought the FCC already put too many regulations and restrictions on packet radio another group pops up choking off data flow with more rules and 'organizational-strategies'.

AS I UNDERSTAND IT, the main explanation for shutting down the gate is that certain individuals 'believe' that amprnet should only exist in the ham-radio-RF world. In their minds any use of 'wire-networks' for the purpose of sending ham radio packet is somehow 'unclean'...

This is nothing more than modern-day religious Puritanism. But, that's OK. To each his own. If there are those that believe amprnet should only be sent on ham radios owned and operated by hams that's kool, let them operate that way.

I just resent having their 'beliefs' rammed down everyone's throat.

This move to keep the gateway SHUT-DOWN until the issue can be PRIVATELY discussed and the exact functionality of the gate can be determined is nothing more than a political-strong-arm-power-play brought to you by the newly self-appointed n.e.amprnet 'government'.

Were I the sysop of the gateway in Emass, I'd tell them to take their puritanical B.S. and stuff it.

You want to TALK about how a specific gate or node should function within the amprnet system, fine. If someone's system is causing problems with traffic or flow, no problem, let's deal with it. THIS issue, on the other hand, is nothing more than a religious 'belief'

issue and the newly self-appointed amprnet governors have just
mandated all in their area become "believers". Like it or not.

Ya know when you think about it, this was really a slick move. First,
be sure to cut out the possibility of any discussion with other parts
of the amprnet by isolating the guys using the gate, then pump the
'new political agenda' without opposition. Very slick.

Turn the thing back on and let some discussion flow!

If you disagree with this "back-room-power-play" why not drop a note
to one or more of the newly elected N.E.amprnet officials. I am sure
they will welcome an honest and OPEN discussion of the issue.

With the gateway down no traffic is flowing into the repressed area.
If are in the area previously served by the gw.w1mx.ampr.org gate,
please drop me a note. This action deserves some serious response.

1243. 2-Meter Handhelds ~= Amateur Cellular?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-26 00:00:00 UTC
From: bsanders@ncsa.uiuc.edu
Message-ID: <bsanders-2602961231240001@slip-bsanders.ncsa.uiuc.edu>
Source record: 38283

Please pardon my starry-eyed naivete and dream along with me, if you will...

What I'd like to know is this: What sort of testbeds or infrastructures
are in place (anywhere) that allow for hand-held radio xcvr's to be used
for anything even remotely resembling cellular-like service? What I mean
by this is:

* Origination of telephone (POTS) calls through local repeater(s).

* Signalling for incoming calls (I have no idea how this would work,
except using a conventional pager setup in tandem w/ hand-held xcvr,
or some kind of very sophisticated hand-held with a coded ID.)

* Tracking of location within range of xcvr and repeater with notification
of weak signal (or even possibility of auto-switching to another repeater?)

If you follow what I'm getting at here, it would require a lot of sophisticated
software and possibly some specialized hardware at the repeater side (
which would actually be a little bi-directional wireless-to-telco
gateway.)

I'm not a HAM (of any stripe - yet); but I have had several HAM friends who
have instructed me about the capabilities of various flavors of XCVR's,
RF amps., RF bands, antennas, repeaters, etc. Anyway, my expertise
is mostly in computers and TCP/IP networking concepts. I'm envisioning
an automated system for voice communications using hand-helds in tandem with
POTS telephone service (as outlined above), and would be grateful for *any*
comments, suggestions or "other feedback" (preferably via private email to
save bandwidth in this group). Don't just tell me I'm crazy - tell me WHY ;)

Apologies if this posting is inappropriate. I tried to find the most
appropriate amateur radio newsgroup. This seemed like the one.

Thanks for any help.

Barry

BTW: My intentions are fully non-profit. I'm very much against the
commercial domination of our public airwaves. My vision is for a system
that allows cellular-like convenience for licensed citizens on public-
access RF bands using off-the-shelf hardware of modest cost, and organized
by local volunteer organizations.

Look at the Document for the 5.1 upgrade.

You must set HTEXT first, then you can use this to foward messages in
MYPBBS to a local PBBS set in PBFOWARD.

>1. It is not a host mode program.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Well, I try to keep my postings about KaWin extremely brief, but this MISINFORMATION begs more than a simple correction. It suggests that some who have evalualted KaWin might not have reviewed the principle features. So here for all is a short summary:

All TNC communication modes.

VHF and HF packet radio. CW, Rtty, Ascii and Navtex. Amtor, Pactor, G-Tor, Tor-standby and G-Tor Monitor.

Host mode interace.

Host mode means KaWin and your TNCs communicate computer to computer. Host mode means full use of your dual-port TNCs. Simultaneous multiple TNCs, multiple ports, multiple streams and multiple radios.

Native MS Windows program.

KaWin is a no compromise design for MS Windows in 486 and Pentium systems. Only a native Windows program can offer fully event-driven communications. Looks like, feels like and talks to your other Windows applications. Separate send and receive windows for each QSO, radio and TNC. Intuitive menus, full mouse support and on-line help make KaWin is easy to learn. Windows accelerator keys and shortcuts keys for operating speed. Easy and clean to install and remove - leaves no residue.

Flexibility

Hundreds of configurable options for complete customization. Quick keys, Quick connects, Brag files, CQ robot, Restartable binary file transfers, Ansi graphics and much more.

And you can download and test the full working program directly from the web page below.

Isn't the Thor 2 similar to the Sinclair QL? Siskin used to have details
of the QL connections, and some packet software for it.

People are like sheep. One sheep finds a hill with nice green grass and no shit. 10 other sheep come over, stomp all over the damn grass, and piss and shit on it. Original sheep moves on.

Translation:

Hams are sheep. Someone puts up a data pump, and everyone sucks on it. Then 5 other Hams put up a cross-over frequency set of NetRoms/BPQ/Rose crap (piss and poop). Original sheep moves on.

Solution:

Pick one of the millions of Ham frequencies and put up your own data pump. Make it do something of value. Then offer an user port to the masses on at least two user frequencies (2 - 9600, 2 - 1200, or whatever). Use whatever IP address trips your trigger. I would use 10.x.x.x and have a blast. Then put up user ports on the local IP plan. If they won't give you any, steal them. Use 44.x.128-255.x as they don't control those. Move if Brian tells you (he owns those bits).

Then have fun anyway...

Steve

The NORD><LINK version (with thousands of enhancements and bug fixes ;-))
is available on the NORD><LINKs WWW pages:
http://deister.aball.de/~pg/nordlink/tf.htm

Or look on nic.funet.fi in /pub/ham/packet/misc for tf27b.zip.

Latest version for TNC2 is TF27b, I don't think there is one for the TNC1.
There should be a TF27 for the PK232 available, but I don't know for sure.

>Dennis W5XO

Set your WWW browser to http://www.ultranet.com/~sstv for loads of
information on SSTV. In the "What's New" section you should find
a reference to HISCAN which is alternative software for the ViewPort
VGA interface.

There is also some type of TSR program which allows it to be
used with JVFAX. Look in the links section for pointers to other
SSTV pages. A couple people, such as WB4EJC, have large collections
of all the freeware/shareware ready for downloading.

Neither of these is for Windows 95, as specified in the title.
But at least you now have the choice between 3 different MS-DOS
programs for that interface.

1268. Re: Operating a TNC using the Kenwood 13 pin DIN plug

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-02-27 00:00:00 UTC
From: Carl Morgan <MorganCL@MUOhio.EDU>
Message-ID: <4h04rq$3ptd@rose.muohio.edu>
Source record: 38308

Yes. My KAM is connected via the data connector. Initially
connected to a `440S and now a `850S. Works great!

On the latter (850S), I'm using the FSK (RCA) connector for all
HF modes except packet. RX selectivity is better although I do
have to take a quick look (on SSB) before initiating a call.

If you need the connections, E-Mail me (don't post; I don't see
this group often).

The `850S setup is a little different from the `440S in that the
former has a pre-amp for the AFSK signal before being applied to
the modulator and the `440S does not. Not familiar with the `450
or `870S.

Go for it. Although soldering to the 13-pin DIN is no picnic,
the effort is, I think, worth it.

>Mike:
>
>I've been thinking seriously about AEA's PK-900, but most everyone else says the
>PK-232 is a more compatible way to go. Could you please give me some Pro's & Con's?
>
>Thanks, Bill Crocker

It was a no-brainer for me.

I needed TWO TNC's ne that could be used for 9600 baud and one that could be used for 1200 baud and I only had ONE spare comm port in the system.

Since the PK900 can be used in that mode, software is already available to run BOTH TNC's at the same time over one comm port and one IRQ, other than similar things that did the same job, that was my choice.

Another reason was that I happen to run HF CW and use a TNC to generate the SENT code. Not all the time, but when I want to. I do a repeat of the NCDX DX list that Bob W6TI sends out each Sunday night on 14002 and 7016 which I process inbound from him at 2:00 GMT. It goes into a text file, and then out from me on 3516 at 0245 GMT each Sunday night or, really, Monday morning....

The KAM units are a disaster on HF CW. They (as well as a lot of other uninformed folk) have the mistaken notion that altering the ratio between dots and dashes in the sent code is WEIGHT!

It is NOT. With the lousy performance of most store bought rigs as to break-in CW, it is absolutely necessary to be able to alter the true WEIGHT of the sent characters to get going full break-in up into the 60-80 WPM range and up.

There are only a couple of rigs that are really good QSK CW rigs. The Ten-Tec line is fabulous as is the ICOM-781. Perhaps some of the later Kenwoods are pretty good, but my FT-1000 needs to be able to get the weight stretched out to make it OK on high speed QSK.

There are only TWO multi-mode TNC's that I know about that offer TRUE weight settings. The MFJ-1278 has it down perfectly. I normally use it for all my CW generation stuff on HF. However, the SECOND group that DOES have it down ALMOST right is AEA.

Both the AEA-232 with the latest ROM code and the PK900 will, and I know this for a fact, because I've done the work and used them both for full QSK on HF, perform correct weight adjustment on the output. I brought the error to their attention way back when the PK-232 first came out and they

corrected the wrong technique of adjusting ratio and saying it was weight.

The AEA products only supported 10 steps of adjustment from -5 to 0 to +5
of some sort. It turns out that one of htose steps is just fine for my sick
designed FT-1000 QSK system, but it DOES work fine. AEA tells me that
in the next revision of firmware for the units, they will go to the same
-50 to 0 to +50 steps of adjustment that MFJ uses.

The MFJ-1278 multi-mode uses the BACKSPACE key to halt QSK in the
middle of a buffer being sent in real-time. That's not bad. The AEA units
use a <CTRL C>, I think, if I remember it right, to bust the buffer for
sending. It took a little more code writing for me to get that unit working
with my station control code, which I wrote for myself, but the AEA units
both work fine and copy CW inbound about as well as anything, I think.

Neither company has software that is really perfect for full QSK by computer.
However, it is neal to use the PK900 for HF on whatever you want and to
also be able to stay on the cluster and watch the play in another mini-window
without buying two TNC's. KAM has this capability and it works well, but
their CW, at least as far as I was able to test was of no value at all to a
serious QSK fan. I thus abandoned even developing my code for any of the
KAM products at all. KAM wasn't even in the mood to even listen to the
problme at all about what needed to be done to get them even competitive
with the other two units.

I guess the most important thing I can say about the PK900 is that it
WORKS, and all the stuff between the two TNC's that comes with the
box as well. The commercial code that you buy for programs for the AEA
stuff works pretty good for the average ham. HB9CVV's THS-850 works
fine wiht native 32bit threaded OS/2 for the boxes, both PK-232 and
PK900, and I am told that PAKET6 also works well in OS/2, however,
at $100 or so, I'm not in the mood to try it with my own programs and
these other to use.

I have had nothing but top service from AEA. I own a PCB-88, a PK-96
and a PK900, as well as a DRSI card and a Baycomm deal.

Over the years, the AEA's have wound up doing all my work.

I don't do satellite. That's another story.

I don't do 19200 or 38400; those are more war stories.

What more can I say?

Mike W5WQN as a guest at leviathan.tamu.edu

1275. FTP thru high speed packet : what rate do you get?

Hi Pete!
I guess you'll have to disable the comport from windows.
Go to: controlpanel\ports\preferences and disable the comport from
windows so windows can't find that port....
I' have done it myself.....i'm runing Winpack 5.4 + Bpq408a with a
simple baycom-modem.....and it works just fine!!

Good luck!
73's Stefan...

I have an MFJ-1276 tnc and am having trouble getting it to work in the PACTOR mode. I talked to MFJ and they said some units had shipped without the IC U24. Mine has U24 installed but Im not sure it is installed correctly. Should pin 1 of the IC go to pin 1 of the IC socket? Mine does not. Could someone with a 1276 take the cover off and have a look.

tnx es 73's Gary

Once upon a time, ranger@eskimo.com (Richard Berndt) wrote (at least in part):
>
>Boy another paided voice for InterFlex.
>
Well Richard, I have to stand up for Interflex. You might very well have some problems, but I want to tell you about my experience. See if you can get this response from any other developer.

I bought PK-Gold for my own use at home here, and have been famously pleased (around here, anyway) with the results.

Shortly after getting used to the program (no command channel, no stream switch, each QSO on its own screen, canned text, autoresponding to callsign,etc etc) I determined that the Only Way to do packet at Field Day was to run Gold. I stuck the appropriate exchange text into an "Alt Key message" location, a greeting into the connect message, and a nice closing blurb in another altkey message.

I was geared up.

This was Friday afternoon. Field Day started Saturday.

Friday night, as I was getting my stuff together, I decided to try it on the air. I changed the MYCALL from KB3JA (me) to W3MUM (the club) and away we went!

WRONG! Gold stopped operating. Wrong callsign, not registered!

I spoke a few words. Grasping at straws, I called the Interflex telephone number at 11:30 PM Friday night, got their recorder and begged, pleaded, and probably complained loudly (but I've forgotten that part) for some help.

I was crushed. All this prep and I can't use the club call. I was resigned to using Yapp. Yikes.

Guess what? They Called Me Back At Almost Midnight and explained the procedure, why they do it like that, and Gave Me The Code to use with the club call! On a Friday night! At midnight. Right before Field Day! (We got the 100 points, BTW. Piece of cake.)

Now I know midnight my time is nine PM their time, but that does not detract from their helpfulness. On a Friday night, to get anybody to respond at all is fantastic, but to get a return call And a solution at nine o'clock his time is just outta' sight.

That's the kind of people at Interflex. I recommend their products every time I get the chance.

They will always have my business, and I hope you give them yours.

73

Hello,

In Holland, it is legal to use packet on 11 meters, as long as you don't modify any tranceivers. Due to the used tranceivers, we can only use 1200 baud packet. Also 11 meters isn't a good frequency to use higher baudrates.

I was thinking to use realtime compression (lzh) to get a higher troughput of bytes. I can use compression, because it is legal. It is not encryption.

Many stations in Holland use TFPCX together with the baycom-modem. It is possible to send 256-character-strings to the interface. Using lzh-compression, we still can send these strings to the interface, but thanks to the compression the actual througput is bigger.

Is there anyone who experimented with it? Are there other digital modes to reach higher througput using the small bandwith on 11 meters?

I hope to get some response...

Greetings,

Subject: AEA Controllers, what's best?

In <3130A168.3D26@mail.rust.net>, Bill Crocker <billc@mail.rust.net> writes:
>Mike:
>
>I've been thinking seriously about AEA's PK-900, but most everyone else says the
>PK-232 is a more compatible way to go. Could you please give me some Pro's & Con's?
>
>Thanks, Bill Crocker

It was a no-brainer for me.

I needed TWO TNC's ne that could be used for 9600 baud and one that could
be used for 1200 baud and I only had ONE spare comm port in the system.

Since the PK900 can be used in that mode, software is already available to
run BOTH TNC's at the same time over one comm port and one IRQ, other
than similar things that did the same job, that was my choice.

Another reason was that I happen to run HF CW and use a TNC to generate
the SENT code. Not all the time, but when I want to. I do a repeat of the
NCDX DX list that Bob W6TI sends out each Sunday night on 14002 and 7016
which I process inbound from him at 2:00 GMT. It goes into a text file,
and then out from me on 3516 at 0245 GMT each Sunday night or, really,
Monday morning....

The KAM units are a disaster on HF CW. They (as well as a lot of other
uninformed folk) have the mistaken notion that altering the ratio between

dots and dashes in the sent code is WEIGHT!

It is NOT. With the lousy performance of most store bought rigs as to break-in CW, it is absolutely necessary to be able to alter the true WEIGHT of the sent characters to get going full break-in up into the 60-80 WPM range and up.

There are only a couple of rigs that are really good QSK CW rigs. The Ten-Tec line is fabulous as is the ICOM-781. Perhaps some of the later Kenwoods are pretty good, but my FT-1000 needs to be able to get the weight stretched out to make it OK on high speed QSK.

There are only TWO multi-mode TNC's that I know about that offer TRUE weight settings. The MFJ-1278 has it down perfectly. I normally use it for all my CW generation stuff on HF. However, the SECOND group that DOES have it down ALMOST right is AEA.

Both the AEA-232 with the latest ROM code and the PK900 will, and I know this for a fact, because I've done the work and used them both for full QSK on HF, perform correct weight adjustment on the output. I brought the error to their attention way back when the PK-232 first came out and they corrected the wrong technique of adjusting ratio and saying it was weight.

The AEA products only supported 10 steps of adjustment from -5 to 0 to +5 of some sort. It turns out that one of htose steps is just fine for my sick designed FT-1000 QSK system, but it DOES work fine. AEA tells me that in the next revision of firmware for the units, they will go to the same -50 to 0 to +50 steps of adjustment that MFJ uses.

The MFJ-1278 multi-mode uses the BACKSPACE key to halt QSK in the middle of a buffer being sent in real-time. That's not bad. The AEA units use a <CTRL C>, I think, if I remember it right, to bust the buffer for sending. It took a little more code writing for me to get that unit working with my station control code, which I wrote for myself, but the AEA units both work fine and copy CW inbound about as well as anything, I think.

Neither company has software that is really perfect for full QSK by computer. However, it is neal to use the PK900 for HF on whatever you want and to also be able to stay on the cluster and watch the play in another mini-window without buying two TNC's. KAM has this capability and it works well, but their CW, at least as far as I was able to test was of no value at all to a serious QSK fan. I thus abandoned even developing my code for any of the KAM products at all. KAM wasn't even in the mood to even listen to the problme at all about what needed to be done to get them even competitive with the other two units.

I guess the most important thing I can say about the PK900 is that it WORKS, and all the stuff between the two TNC's that comes with the box as well. The commercial code that you buy for programs for the AEA stuff works pretty good for the average ham. HB9CVV's THS-850 works fine wiht native 32bit threaded OS/2 for the boxes, both PK-232 and PK900, and I am told that PAKET6 also works well in OS/2, however, at $100 or so, I'm not in the mood to try it with my own programs and

these other to use.

I have had nothing but top service from AEA. I own a PCB-88, a PK-96
and a PK900, as well as a DRSI card and a Baycomm deal.

Over the years, the AEA's have wound up doing all my work.

I don't do satellite. That's another story.

I don't do 19200 or 38400; those are more war stories.

What more can I say?

Subject: HF packet. Worth getting set up?

Will too my 2-cents in here. I agree with the posts that say HF packet is a slow, poor keyboarding mode. Still, it has certain features you won't find on PACTOR or G-TOR.

My son lives in OKC, about 200 miles from me. He has only a 2M packet station. However, we exchange packet mail, and enjoy an occassional keyboard connect via a 2M/40M node there. I get on 40M packet, and he is on 2M packet. Can't do that on one of the 'tors.

The other day the band was too long for me to get into OKC, so I connected to a node in Denver, then back to OKC, then crossed over to my son on 2M. Again, can't do that on one of the 'tors.

One other thing that is probably as much a slam on HF packet as it is a plus, but on one of the 'tors the throughput is generally so good you have to keep your head down and keep typing. Some slower typests get a bit frustrated with the link always waiting on them -- and, from personal experience, I can tell you it gets a bit tireing to be in a link that could be flying, watching a guy type one character at a time, reducing the conversation to about 5wpm! On HF packet, things do go a lot slower, generally a bad thing! However, you can work HF packet, talk on 2M phone, drink a cup of coffee, and watch the Weather Channel at the same time - if that is what you want to do - ha! Can't do that on one of the 'tors!

Just one man's opinion -- but an opinion I highly value!

73 all -- Scott

From: dmobley@encore.com (Dennis Mobley)
Subject: Is KaWin (host packet program) worth it?

KaWin is worth the 79 bucks.
It has alot of very nice features and it works.
Stan Huntting the author has put a great deal of effort into this package.

KaWin is a HOST mode KAM TNC package and I use it with
KAM+ Rev8, KAM 9612 and KPC3 with no problems.

In fact if I had the serial ports, I could run all three
at the same time.

One point, if you have a system that is less then 8 megs of memory
and/or less the a 486 then the performance might be a bit slow.

System I have tested KaWin on...
1. 386sx 4megs W3.11 Slow but works
2. 486dx2 8megs W3.11 Work very well
2. 486dx2 8megs W95 Work very well
3. P100 8megs W95 Work very well
4. P90 32megs W-NT Work very well

People are like sheep. One sheep finds a hill with nice green grass and no
shit. 10 other sheep come over, stomp all over the damn grass, and piss and
shit on it. Original sheep moves on.

Translation:

Hams are sheep. Someone puts up a data pump, and everyone sucks on it.
Then 5 other Hams put up a cross-over frequency set of NetRoms/BPQ/Rose
crap (piss and poop). Original sheep moves on.

Solution:

Pick one of the millions of Ham frequencies and put up your own data pump. Make it do something of value. Then offer an user port to the masses on at least two user frequencies (2 - 9600, 2 - 1200, or whatever). Use whatever IP address trips your trigger. I would use 10.x.x.x and have a blast. Then put up user ports on the local IP plan. If they won't give you any, steal them. Use 44.x.128-255.x as they don't control those. Move if Brian tells you (he owns those bits).

Then have fun anyway...

Steve

From: Jim Devenport <jdevenport@lanl.gov>
Subject: HF packet. Worth getting set up?

Heh, your experience is not at ALL unusual. HF packet is so crowded it is very difficult to decode many packets at all. Some tips if you MUST continue trying HF packet:
Set your GarbageMode on, so it will show incomplete packets.
Use only a good stable late model radio, the slightest drift will render packets undecipherable.
It is much easier to QSO with someone on packet using the unproto mode, i.e. you don't connect to the other station at all, just send the sentence or line unconnected. With your garbagemode enabled you can at least carry on a semblance of a QSO with someone. The "perfect packet

or reject-it-all" methodology of packet "connections" is OK only if you are trying to send a program or perfect error-free copy and you can setup the connection and walk away and do something useful while your TNC fights hopelessly on, trying to get it through. This works quite well on VHF with relatively noise-free paths but is an almost useless way of growing old on HF.
Use the less popular frequencies if possible, such as 28.160, 28.170, 28.180, etc... when the band is open good the lack of 20 meter QRM will greatly improve the performance.
If you must stick to HF I recommend switching to RTTY or AMTOR, the modes are much more usable with HF propagation.

>I am deciding if I should register KaWin. KaWin is a host packet
>program. The registration cost US$79.
>Please tell me what you think of the program, that is if you use the
>program.
>thanks
>sherwin

I have been using KaWin since, hummm, late summer? Can't remember, but it was before Win95 came out. Anyway for me it's a great program. At present I am running a KPC-9612 AND a KAM on the same computer using KaWin.
I have only experienced minor glitches, such as "out of memory". As it was explained to me by the author, there were some minor incompatibilities with KaWin (older version) and Win95. He seems to have solved these problems with the release that just came out this month. He has added several new features, like selectable filtering of non printing characters, quicker access to the HF mode changes and setups.

Over all it's a very good product, and so far it has been very well supported.

Look at the Document for the 5.1 upgrade.

You must set HTEXT first, then you can use this to foward messages in
MYPBBS to a local PBBS set in PBFOWARD.

Subject: KPC-9612 Bug?

Any of your KPC-9612 owners out there having problems with
version 6.0 software?? Seems that two individuals here locally
had quite a few messages pass through thier personal mailboxes.
The mailbox does a RENUMBER on all the messages restarting back
with number 1,2,3, ... At about the same time they experienced
strange problems, with characters not working. Turned out that the
REDISPLAY was changed from $12 (ctl R) to $4C (L) with one guy,
the other's was changed to $31 (1).

If you have this problem or have heard of it, please send me a
reply. Thanks.

Try ftp.tapr.org in /tapr/software_lib/terminal/sp650.exe. This is the
last freeware version. There is a version 9.5 available commercially.

First: make sure you are in command mode (Control-C usually does it)

Second: type Mode Pactor
(mode PTL also works)

third: have fun! Pactor is a great mode

>Dennis W5XO

Set your WWW browser to http://www.ultranet.com/~sstv for loads of
information on SSTV. In the "What's New" section you should find
a reference to HISCAN which is alternative software for the ViewPort
VGA interface.

There is also some type of TSR program which allows it to be
used with JVFAX. Look in the links section for pointers to other
SSTV pages. A couple people, such as WB4EJC, have large collections
of all the freeware/shareware ready for downloading.

Neither of these is for Windows 95, as specified in the title.
But at least you now have the choice between 3 different MS-DOS
programs for that interface.

Based on the message-ids, I presume the original poster resides in the US, which means using the Euorpean version would cause a violation of RSA/PKP's patents, whereas the US version doesn't, since it uses RSA's kit to do the public key crypto. The European version is fine for outside the US (and Canada?) because RSA/PKP didn't patent it outside the US.

You can get source code if you want it for the US version. People keep speculating that it's been doctored, and no one shows where. I would write it off as urban legend.

PGP is available from http://web.mit.edu/network/pgp/

From: Carl Morgan <MorganCL@MUOhio.EDU>
Subject: Operating a TNC using the Kenwood 13 pin DIN plug

Yes. My KAM is connected via the data connector. Initially
connected to a `440S and now a `850S. Works great!

On the latter (850S), I'm using the FSK (RCA) connector for all
HF modes except packet. RX selectivity is better although I do
have to take a quick look (on SSB) before initiating a call.

If you need the connections, E-Mail me (don't post; I don't see
this group often).

The `850S setup is a little different from the `440S in that the
former has a pre-amp for the AFSK signal before being applied to
the modulator and the `440S does not. Not familiar with the `450
or `870S.

Go for it. Although soldering to the 13-pin DIN is no picnic,
the effort is, I think, worth it.

From: nl1rea@cbpackhv.xs4all.NL
Subject: Realtime compression ax25?

Hello,

In Holland, it is legal to use packet on 11 meters, as long as you don't modify any tranceivers. Due to the used tranceivers, we can only use 1200 baud packet. Also 11 meters isn't a good frequency to use higher baudrates.

I was thinking to use realtime compression (lzh) to get a higher troughput of bytes. I can use compression, because it is legal. It is not encryption.

Many stations in Holland use TFPCX together with the baycom-modem. It is possible to send 256-character-strings to the interface. Using lzh-compression, we still can send these strings to the interface, but thanks to the compression the actual througput is bigger.

Is there anyone who experimented with it? Are there other digital modes to reach higher througput using the small bandwith on 11 meters?

I hope to get some response...

The NORD><LINK version (with thousands of enhancements and bug fixes ;-))
is available on the NORD><LINKs WWW pages:
http://deister.aball.de/~pg/nordlink/tf.htm

Or look on nic.funet.fi in /pub/ham/packet/misc for tf27b.zip.

Latest version for TNC2 is TF27b, I don't think there is one for the TNC1.
There should be a TF27 for the PK232 available, but I don't know for sure.

>Mike:
>
>I've been thinking seriously about AEA's PK-900, but most everyone else says the
>PK-232 is a more compatible way to go. Could you please give me some Pro's & Con's?

>
>Thanks, Bill Crocker

It was a no-brainer for me.

I needed TWO TNC's ne that could be used for 9600 baud and one that could be used for 1200 baud and I only had ONE spare comm port in the system.

Since the PK900 can be used in that mode, software is already available to run BOTH TNC's at the same time over one comm port and one IRQ, other than similar things that did the same job, that was my choice.

Another reason was that I happen to run HF CW and use a TNC to generate the SENT code. Not all the time, but when I want to. I do a repeat of the NCDX DX list that Bob W6TI sends out each Sunday night on 14002 and 7016 which I process inbound from him at 2:00 GMT. It goes into a text file, and then out from me on 3516 at 0245 GMT each Sunday night or, really, Monday morning....

The KAM units are a disaster on HF CW. They (as well as a lot of other uninformed folk) have the mistaken notion that altering the ratio between dots and dashes in the sent code is WEIGHT!

It is NOT. With the lousy performance of most store bought rigs as to break-in CW, it is absolutely necessary to be able to alter the true WEIGHT of the sent characters to get going full break-in up into the 60-80 WPM range and up.

There are only a couple of rigs that are really good QSK CW rigs. The Ten-Tec line is fabulous as is the ICOM-781. Perhaps some of the later Kenwoods are pretty good, but my FT-1000 needs to be able to get the weight stretched out to make it OK on high speed QSK.

There are only TWO multi-mode TNC's that I know about that offer TRUE weight settings. The MFJ-1278 has it down perfectly. I normally use it for all my CW generation stuff on HF. However, the SECOND group that DOES have it down ALMOST right is AEA.

Both the AEA-232 with the latest ROM code and the PK900 will, and I know this for a fact, because I've done the work and used them both for full QSK on HF, perform correct weight adjustment on the output. I brought the error to their attention way back when the PK-232 first came out and they corrected the wrong technique of adjusting ratio and saying it was weight.

The AEA products only supported 10 steps of adjustment from -5 to 0 to +5 of some sort. It turns out that one of htose steps is just fine for my sick designed FT-1000 QSK system, but it DOES work fine. AEA tells me that in the next revision of firmware for the units, they will go to the same -50 to 0 to +50 steps of adjustment that MFJ uses.

The MFJ-1278 multi-mode uses the BACKSPACE key to halt QSK in the middle of a buffer being sent in real-time. That's not bad. The AEA units use a <CTRL C>, I think, if I remember it right, to bust the buffer for sending. It took a little more code writing for me to get that unit working

with my station control code, which I wrote for myself, but the AEA units both work fine and copy CW inbound about as well as anything, I think.

Neither company has software that is really perfect for full QSK by computer. However, it is neal to use the PK900 for HF on whatever you want and to also be able to stay on the cluster and watch the play in another mini-window without buying two TNC's. KAM has this capability and it works well, but their CW, at least as far as I was able to test was of no value at all to a serious QSK fan. I thus abandoned even developing my code for any of the KAM products at all. KAM wasn't even in the mood to even listen to the problme at all about what needed to be done to get them even competitive with the other two units.

I guess the most important thing I can say about the PK900 is that it WORKS, and all the stuff between the two TNC's that comes with the box as well. The commercial code that you buy for programs for the AEA stuff works pretty good for the average ham. HB9CVV's THS-850 works fine wiht native 32bit threaded OS/2 for the boxes, both PK-232 and PK900, and I am told that PAKET6 also works well in OS/2, however, at $100 or so, I'm not in the mood to try it with my own programs and these other to use.

I have had nothing but top service from AEA. I own a PCB-88, a PK-96 and a PK900, as well as a DRSI card and a Baycomm deal.

Over the years, the AEA's have wound up doing all my work.

I don't do satellite. That's another story.

I don't do 19200 or 38400; those are more war stories.

What more can I say?

From: grc@arn.NET (Scott\, G.R. \, Cundiff)
Subject: HF packet. Worth getting set up?

Will too my 2-cents in here. I agree with the posts that say HF packet is a
slow, poor keyboarding mode. Still, it has certain features you won't find
on PACTOR or G-TOR.

My son lives in OKC, about 200 miles from me. He has only a 2M packet
station. However, we exchange packet mail, and enjoy an occassional
keyboard connect via a 2M/40M node there. I get on 40M packet, and he is on
2M packet. Can't do that on one of the 'tors.

The other day the band was too long for me to get into OKC, so I connected
to a node in Denver, then back to OKC, then crossed over to my son on 2M.
Again, can't do that on one of the 'tors.

One other thing that is probably as much a slam on HF packet as it is a
plus, but on one of the 'tors the throughput is generally so good you have
to keep your head down and keep typing. Some slower typests get a bit
frustrated with the link always waiting on them -- and, from personal
experience, I can tell you it gets a bit tireing to be in a link that could
be flying, watching a guy type one character at a time, reducing the

conversation to about 5wpm! On HF packet, things do go a lot slower, generally a bad thing! However, you can work HF packet, talk on 2M phone, drink a cup of coffee, and watch the Weather Channel at the same time - if that is what you want to do - ha! Can't do that on one of the 'tors!

Just one man's opinion -- but an opinion I highly value!

73 all -- Scott

KaWin is worth the 79 bucks.
It has alot of very nice features and it works.
Stan Huntting the author has put a great deal of effort into this package.

KaWin is a HOST mode KAM TNC package and I use it with
KAM+ Rev8, KAM 9612 and KPC3 with no problems.

In fact if I had the serial ports, I could run all three
at the same time.

One point, if you have a system that is less then 8 megs of memory
and/or less the a 486 then the performance might be a bit slow.

System I have tested KaWin on...
1. 386sx 4megs W3.11 Slow but works
2. 486dx2 8megs W3.11 Work very well
2. 486dx2 8megs W95 Work very well
3. P100 8megs W95 Work very well
4. P90 32megs W-NT Work very well

Subject: Compiling WA8DED/NORDLINK The Firmware

Hi,

I have managed to get some sources for The Firmware but do not
know what compiler/assembler/linker I should use to compile this. I am
trying to recompile a version of The Firmware to include support for the
Dallas DS-1216 real time clock or some other real time clock. I would
appreciate if anyone could furnish the information I need to compile my
own version of The Firmware. From what I can make out of the makefile,
they appear to be using a C compiler called QC or Q/C-Compiler and XAS
as the assembler for the Z-80 code, and XLNK for the linker. Thanks.

People are like sheep. One sheep finds a hill with nice green grass and no shit. 10 other sheep come over, stomp all over the damn grass, and piss and shit on it. Original sheep moves on.

Translation:

Hams are sheep. Someone puts up a data pump, and everyone sucks on it. Then 5 other Hams put up a cross-over frequency set of NetRoms/BPQ/Rose crap (piss and poop). Original sheep moves on.

Solution:

Pick one of the millions of Ham frequencies and put up your own data pump. Make it do something of value. Then offer an user port to the masses on at least two user frequencies (2 - 9600, 2 - 1200, or whatever). Use whatever IP address trips your trigger. I would use 10.x.x.x and have a blast. Then put up user ports on the local IP plan. If they won't give you any, steal them. Use 44.x.128-255.x as they don't control those. Move if Brian tells you (he owns those bits).

Then have fun anyway...

Steve

Subject: Help with BPQ v4.08 under windows

Hello ALL

I have installed BPQ ver 4.08 on my bbs hoping to get it to run under windows. Here is where the fun starts

1) BPQCFG compiled ok
2) BPQCODE loaded ok..
3) Start win3.11 (G8BPQ message comes up when windows starts)
4) Start FBB
5) Windows says that a dos application is trying to take control of a comms port. I can't seem to get furthur than this..

I have placed the .dll and.386 file into the windows system directory as per the doco. What have I missed out on ?? It maybe simple but I can't see it !!! Any help would be appreciated !!!!

Cheers..Pete..vk2yx

From: Jim Devenport <jdevenport@lanl.gov>
Subject: HF packet. Worth getting set up?

Heh, your experience is not at ALL unusual. HF packet is so crowded it
is very difficult to decode many packets at all. Some tips if you MUST
continue trying HF packet:
Set your GarbageMode on, so it will show incomplete packets.
Use only a good stable late model radio, the slightest drift will render
packets undecipherable.
It is much easier to QSO with someone on packet using the unproto mode,
i.e. you don't connect to the other station at all, just send the
sentence or line unconnected. With your garbagemode enabled you can at
least carry on a semblance of a QSO with someone. The "perfect packet
or reject-it-all" methodology of packet "connections" is OK only if you
are trying to send a program or perfect error-free copy and you can
setup the connection and walk away and do something useful while your
TNC fights hopelessly on, trying to get it through. This works quite
well on VHF with relatively noise-free paths but is an almost useless
way of growing old on HF.
Use the less popular frequencies if possible, such as 28.160, 28.170,
28.180, etc... when the band is open good the lack of 20 meter QRM will
greatly improve the performance.
If you must stick to HF I recommend switching to RTTY or AMTOR, the
modes are much more usable with HF propagation.

>Please tell me what you think of the program, that is if you use the
>program.
>thanks
>sherwin

I have been using KaWin since, hummm, late summer? Can't remember, but it
was before Win95 came out. Anyway for me it's a great program. At present
I am running a KPC-9612 AND a KAM on the same computer using KaWin.

I have only experienced minor glitches, such as "out of memory". As it was explained to me by the author, there were some minor incompatibilities with KaWin (older version) and Win95. He seems to have solved these problems with the release that just came out this month. He has added several new features, like selectable filtering of non printing characters, quicker access to the HF mode changes and setups.

Over all it's a very good product, and so far it has been very well supported.

>Thanks
>Dennis W5XO

Set your WWW browser to http://www.ultranet.com/~sstv for loads of
information on SSTV. In the "What's New" section you should find
a reference to HISCAN which is alternative software for the ViewPort
VGA interface.

There is also some type of TSR program which allows it to be
used with JVFAX. Look in the links section for pointers to other
SSTV pages. A couple people, such as WB4EJC, have large collections
of all the freeware/shareware ready for downloading.

Neither of these is for Windows 95, as specified in the title.
But at least you now have the choice between 3 different MS-DOS
programs for that interface.

Subject: TNC Query

Hello.

I have a generic TNC question.

I am in the market to buy one, and would like to know the difference between a Katronics KPC-2 and a KPC-3.

Both offer KA-Node, 32K ram, PBBS, WeFax, Kiss and host mode to name a few. I know the KPC-3 will run off an internal battery, but other than that, what is the difference between the two?

The 2 is $159.95, and the 3 is $109.95...what gives??

TIA, & 73.

Based on the message-ids, I presume the original poster resides in the US, which means using the Euorpean version would cause a violation of RSA/PKP's patents, whereas the US version doesn't, since it uses RSA's kit to do the public key crypto. The European version is fine for outside the US (and Canada?) because RSA/PKP didn't patent it outside the US.

You can get source code if you want it for the US version. People keep speculating that it's been doctored, and no one shows where. I would write it off as urban legend.

PGP is available from http://web.mit.edu/network/pgp/

From: Carl Morgan <MorganCL@MUOhio.EDU>
Subject: Operating a TNC using the Kenwood 13 pin DIN plug

Yes. My KAM is connected via the data connector. Initially
connected to a `440S and now a `850S. Works great!

On the latter (850S), I'm using the FSK (RCA) connector for all
HF modes except packet. RX selectivity is better although I do
have to take a quick look (on SSB) before initiating a call.

If you need the connections, E-Mail me (don't post; I don't see
this group often).

The `850S setup is a little different from the `440S in that the
former has a pre-amp for the AFSK signal before being applied to
the modulator and the `440S does not. Not familiar with the `450
or `870S.

Go for it. Although soldering to the 13-pin DIN is no picnic,
the effort is, I think, worth it.

From: nl1rea@cbpackhv.xs4all.NL
Subject: Realtime compression ax25?

Hello,

In Holland, it is legal to use packet on 11 meters, as long as you don't
modify any tranceivers. Due to the used tranceivers, we can only use 1200
baud packet. Also 11 meters isn't a good frequency to use higher
baudrates.

I was thinking to use realtime compression (lzh) to get a higher troughput
of bytes. I can use compression, because it is legal. It is not encryption.

Many stations in Holland use TFPCX together with the baycom-modem. It is
possible to send 256-character-strings to the interface. Using
lzh-compression, we still can send these strings to the interface, but
thanks to the compression the actual througput is bigger.

Is there anyone who experimented with it? Are there other digital modes to
reach higher througput using the small bandwith on 11 meters?

I hope to get some response...

|> /hamradio/packet/wa8ded.

The NORD><LINK version (with thousands of enhancements and bug fixes ;-) )
is available on the NORD><LINKs WWW pages:
http://deister.aball.de/~pg/nordlink/tf.htm

Or look on nic.funet.fi in /pub/ham/packet/misc for tf27b.zip.

Latest version for TNC2 is TF27b, I don't think there is one for the TNC1.
There should be a TF27 for the PK232 available, but I don't know for sure.

I have a 440 and a (old) PK232, and to be quite honest, there wasn't
quite enough drive on the audio side (although one _could_ use fsk ?)
For RX though it was fine...

We have been playing with 9600 baud tcp/ip using jnos. We have seen rates
as high as 700 bps but it takes a good band condintion to get that.

We have had our tcp window at 7300 bytes

1290. HF Packet. Is it worth setting up?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-01 00:00:00 UTC
From: dick@tmh.ORG
Message-ID: <96030118065@tmh.org>
Source record: 38330

I don't understand why the following has escaped all you experts.
I'm not an expert, but it seems plain as the nose on my face.

Of course!! Pactor USUALLY does have much better throughput than
HF packet! That's simply because only two stations are using the
channel. You pactorites! (I'm one of them.) Haven't you noticed that

when a "bigger" station than you gets on "your" channel, he can knock
you for a loop and you get no data transferred? You even get
disconnected!

That doesn't happen so quickly on HF Packet. You just patiently keep
retrying each packet until it finally gets through and you get your
ack back.

BUT! IF THE HF PACKET CHANNEL IS CLEAR ... (like you expect it to be
when running Pactor) you can pass data back and forth MORE QUICKLY
THAN YOU CAN ON PACTOR. It can even seem like full duplex! Now
that's
exacty why VHF/UHF packet is so successful! .... very little channel
competition.

And how did we ever get into this bind that requires 10 packet QSO's
to occur on one HF channel? No other mode has ever had to do this.
Even reducing the current channel offset by half would probably work
90%
better and cram twice the QSO's into the same spectrum. I figure that
about 2 packet QSO's can go on on one HF channel and get along
respectably.
And those would be done and gone in about a tenth the time. So that
would give us a 40 times improvement on the effectiveness of HF
packet.
How's that for working the numbers? Probably a bit faulty. But the
point is that what we are doing now with HF packet is rediculous and
can be greatly improved tomorrow.

So you see, HF Packet is not inherently a bad mode. It suffers no
more
than what VHF or UHF packet has the potential to suffer. The "line of

sight" bands merely "shelter" packet from the realities of life that
bring criticism to HF packet.

A THOUGHT QUESTION: Why do we NOT run Pactor on UHF?? Hmm?

There are two reasons HF packet is getting all this "bad press."
(You smart guys, stay with me on this...)

1. Not all stations can "hear" the station(s) transmitting. So they
do what the protocol tells them to do... "Scream when you think it's
quiet." Unfortunately someone around the corner is listening to
"another drummer" and can't hear his "drummer" because the guy who
thinks it's quiet is screaming his head off.

2. Further, there's a much wider audience able to hear vastly more
stations than is likely in the VHF bands.

The point of this, of course, is that VHF/UHF packet is "blessed" with
not having to deal with such a diverse and unpredictably dynamic
environment. But put a half-million potential packet users within range
of a UHF packet station and this wouldn't be quite the case.

Another point is that our packet protocol is ready for improvement.
Now I'm not a "from-day-one" packet guru, but I guess we are probably
talking about the "link layer" protocol.

It would seem we need a protocol that calls for all stations on a channel
to be recognized by all other stations who have "joined" as users of the
channel. If a station is attempting to "join" the channel and is not
heard by some stations, the next one in turn who hears the station
attempting to "join" then implements the "joining" by exchanging
appropriate packets with the new station. Then the other stations,
each in turn, would update their list of channel participants and
acknowledge the update.

Note that this process would not mean that all stations are in a common
exchange of data, but all stations would be recognizing and respecting
all exchanges of data. They would be linked in the effort to avoid
collisions. Those linked for data exchange would be sub-sets of those

linked as channel participants.

Signals on the channel not participating in this new protocol would be

treated just as they are now. The benefit would be realized only when
more than two stations on the channel use this protocol.

The overhead of such a polite protocol would increase slightly as more

stations join the channel. All stations would have to operate from an

identical list of channel users even though some stations might be hearing
only one in the group. Packet lengths might have to be adjusted downward
when more stations join and a limit on unsuccessful retries would have

to
be lowered in order to optimize data transfer for all. So data
between
any two stations would run more slowly as more stations join. I can
think of at least one other downside effect (can you?) but at least
data
would flow optimally, all things considered. I think even VHF packet
could
benefit by such a protocol.

Summary:
HF Packet is being done wrong. It could be done just as effectively
as the
"better HF digital modes" by
A. expecting no more than two QSO's per channel or
B. enhancing the protocol to respect every user of the channel that
is
heard by any user of the channel.

What do you think?

Very 73 to all,

Dick - W7DHS Internet: dick@tmh.org

>by this is:
>
>* Origination of telephone (POTS) calls through local repeater(s).

We have this, it's called a phone patch. Not every repeater has one,
but many do.

>* Signalling for incoming calls (I have no idea how this would work,
> except using a conventional pager setup in tandem w/ hand-held xcvr,
> or some kind of very sophisticated hand-held with a coded ID.)

This is a potential problem. Many amateurs consider "reverse" patches
illegal, claiming that they represent an unlicensed person activating
an amateur transmitter. Others consider this signalling to be telemetry,
and permissible, but this perception would be a problem to be overcome.

>* Tracking of location within range of xcvr and repeater with notification
> of weak signal (or even possibility of auto-switching to another repeater?)

Voting systems do something similar for the reception of signals
from mobile and portable stations, but they generally don't switch
transmitters too, IE many receivers are employed but only one strong
central transmitter is used. To get cellular style handoffs from one
independent repeater to another requires AMPS like switching and control
networks, and requires full handshaking between the system and any
portable or mobile transceivers. I don't know of any examples of that
in the amateur radio world.

More important perhaps, most repeaters are independently owned and
operated. Getting the *political* cooperation to form them into
a single network is a daunting challenge. Most repeaters are established
to serve as group gathering places, waterholes in effect, where the
supporters of the machine gather to converse. Most repeaters are not
operated primarily as cellular phone substitutes.

>If you follow what I'm getting at here, it would require a lot of sophisticated
>software and possibly some specialized hardware at the repeater side (
>which would actually be a little bi-directional wireless-to-telco
>gateway.)

To get AMPS style handoffs, you'd need duplex user radios with control channels that would permit protocol handshaking. There are no such user radios in the amateur service at this time. I'd also suggest that there is little interest among amateurs in duplicating the cellular phone network. That type of system isn't well suited to normal amateur repeater operations, which are more typically a group participation style of communications.

The Kantronics 2400 baud systems will work through unmodified radios,
and the HAPN 4800 baud modems are also supposed to work through unmodified
radios. There has been some work in Japan using the 9600 baud FAX modems
for data through unmodified radios (though there are problems with this
in a contending environment). So you aren't limited to just 1200 baud.

Compression has become routine for BBS->BBS message forwarding, but I
haven't heard of its use between ordinary user packet stations. There's
no reason why it won't work, however. Non-packet digital, IE PACTOR,
uses compression routinely.

I've experienced rates ranging from 3000 to 5900 chars per second
doing ftp between 2 JNOS sites using 56kb modems and Ottawa PI2 cards.
The rate is quite sensitive to the nos.ini file parameters. The
rate drops into the 500 to 900 range when going through a store and
forward JNOS router.

Hi Pete!
I guess you'll have to disable the comport from windows.
Go to: controlpanel\ports\preferences and disable the comport from
windows so windows can't find that port....
I' have done it myself.....i'm runing Winpack 5.4 + Bpq408a with a
simple baycom-modem.....and it works just fine!!

Good luck!

Agree up to a point. Its like watching paint dry!
Don't expect lively point to point Qso's.
BUT
Its an achievement to hook up to Moscow or Belgium on Packet, out
through their nodes and explore.
I did it on 20m from Shetland, where I live, to Colchester in South
England, on VHF to LONNY on London, out via wormhole to New York and
had a look around. Took Hours!
Sad Really!

Yes, I use it on my 940S for both the PK232 and the HAL P38 modems.
(separate 13-pin plugs for each) Pin-3 is fixed level output; Pin-4
is the ground shield for the audio output; Pin-11 is data input;
Pin-12 is ground shield for audio input; and Pin-13 is the PTT line.
The most important thing is to use separate shielded lines for each
pin-out .... tie them together to keep things neat .... and lengths
should be as short as possible. IT IS REALLY WORTH THE EFFORT!

CO4_iota- [Cuba (NA-056)] Luis , CT1ESO , has scheduled a DXpedition to La
Juventude Island (Los Canarreos Arch) to be held in March.The IOTA
Ref. is NA-056.Callsigns and dates will be announced later.This
will be a few days DXpedition , Luis is going their in vacations !
FS - [Saint Martin] WX9E (Paul) , N0BSH (Mike) and WE9V (Chad) are in
FS5PL (Lionel) QTH.They will stay their untill March 6th signing
FS/<callsign>.Operation in all bands , look for them in RTTY. QSL
via their Home calls.
FT5 - [Crozet, Kerguelen & Amsterdam] The dates for FR5HR (Rene)
operation are :
FT5W Crozet untill 05/03.
FT5X Kerguelen from 08/03 to 20/03. (12 Days)
FT5Z Amsterdam from 22/03 to 28/03. (6 Days)
The dates could change in case of bad weather cndx.QSL via F5RRH
H5_ses - [South Africa] Starting 31st March 1996 the H5 prefix will be on
the air , the call will be H5ABP - is a special event station
to celebrate the 97th anniversary of World Scouting.Operation on
every sundays.
J5_iota - [Bijagos Arch. AF-020] I4CLK (Franco) is going to this Island from
March 27th. to April 6th.The IOTA ref is AF-020
P5 - [North Korea] The Project Group DPRK is working on a project in P5
and they plan to be active from their as P51DX.Due to bad weather
(severe winter in N.Korea)the DXpedition will not occur before
April 96.They want to give formation to some local people and
develop the Amateur Radio in this country to have some P5's always

on the band , just like ZA (Albania).
PJ7 - [St. Maarten] Untill March 9th, ND5S (Ron), KF5LG (Sue), AA8GL
(Bill) and KB8ZXO (Dorothy) are active from PJ7.They will sign
/PJ7.QSL via home calls.
R1FJ - [Franz Josef Land] R1FJZ (Sergey) will be in this country untill
August 96.He is very active on the low bands (160/80 and 40 mtrs).
Russia can stop financing the Base in a near future and this DXCC
country can become most expensive !!
TF_iota - [Westmann EU-071] ON6QR (Fred), ON7PC (Peter), ON5OO (Jack) and
ON1KSZ (Stef) will be in Iceland. During their stay , March 26th
to April 2nd , they will participate in the CQ WW WPX SSB and
make an operation from Westmann Isl (IOTA EU-071) on March 28th.
They will sign /TF7.QSL via home calls. [Reykjavik = IOTA EU-021]
VP2E - [Anguilla] VP2ES (KC0ZC - Stew), VP2EZ (WA0PUJ - Glenn), VP2E/N0ZSU
(Loring) and VP2E/KL7YL (Vivien) will stay in Anguilla untill March
6th.QSL via home calls.
VQ9 - [Chagos Isl.] Ron , AA5DX , will be active for 4 months from this
Islands as VQ9DX or VQ9RM.Special atention to 160/80 and 40 mtrs.
XX9_iota- [Taipa Isl. AS-075] JE1CTM (Mine) is planning a visit to this Isl.
in Macau.
ZD7 - [St. Helena + Ascension Isl.] Andy (G4ZVJ) will be active as
ZD7VJ from St. Helena only in CW.Possible operation from Ascension
Island as ZD8VJ.Operation period from 29 March to April 12.
QSL via G4ZVJ (See hi new address below on QSL info.)
ZL8 - [Ilha de Kermadec] All the paperwork for this DXpedition is done
and the team is already formed , they only need one JA operator
The Team is : ZL2DX, ZL2HU, ZL2TT, ZL2AL and WA3YVN. Operation will
be from Raoul Isl. for a 11-days effort (4 to 14 of May 1996).
The callsign issued is ZL8RI.They still needing some funds to make
this possible ,send your donations to: SGI Expeditions - Kermadec,
Project, P.O. Box 2235, Melbourne, FL 32902-2235.
ZY5_dfb - [Brazil] From 8 to 10 of March , ZY5A will be active from Marta
Lighthouse (Ref. DFB SC-012).Operation on CW/SSB , 10 to 80 mtrs
and also on the Brazil DX Net (21.225 or 14.240 Mhz , 11:50 UTC).
QSL via PP5SZ, Pedro Sirzanink, Rua Padre Roma 194/704,
Florianopolis/SC, 88010-090, Brazil.
ZW5_dfb - [Brazil] Ararangua Lighthouse will be activated with call ZW5CIA
The period of operation is from 28 to 30 of March.Operation modes
will be CW/SSB , 10 to 80 mtrs and QRV also on the Brazil DX Net.
The Ref. for this Lighthouse is DFB SC-13. QSL via PP5VB:
P.O. Box 13, Imbituba/SC, 88780-000, Brasil.

Top 10 DXCC Most Wanted [RTTY]

This list was a result of a survey conducted in the Digital Journal
published by the International Digital Radio Association (IRDA).
http://www.iea.com/~adrs

1 - P5, North Korea
2 - 5A, Libya
2 - 7O, Yemen
2 - VK0, Heard Island
3 - ZL8, Kermadec
4 - A5, Bhutan
4 - PY0/S, St. Peter & St. Paul Rocks
5 - FT8X, Kerguelen Islands
6 - VK0/M, Macquarie Island
6 - VU/A, Andaman & Nicobar
7 - FT8W, Crozet Island
7 - PY0T, Trindade Island
8 - 3C0, Pagalu Island
9 - T31, Central Kiribati
10- ZL9, Auckland & Campbell Islands

Portuguese Packet Cluster Network -> There have been some news links between
the Portuguese nodes. They used to be only 2 CT nodes linked to the European
Packet Cluster Network but now we have a link the the South part of Portugal
and the result is 8 nodes linked, but not always. Tests are being made to
have a solid and better network !
The nodes are :

CS1GDX (Lisbon , GPDX node)
CS1NDX-5 (Aveiro , NPDXG node)
CT1END-5 (Cacem , support node to CS1GDX)
CT1EPS-5 (Almancil)
CT1EIF-5 (Moura)
CT1EIT-5 (Almada)
CT1YCM-10 (Coimbra)
CT4KQ-5 (Viseu, the only link in HF to the European Cluster Network is
made by this node)

CS8B & CT6ARU QSL's -> The QSL's for CS8B , Morraceira Isl , are printed.We
are waiting for them to start sending replies as soon as possible.Also the
CT6ARU has a big delay due to burocratic problems.When we have the CT6ARU
QSL's ready we will inform you !

Portuguese Activations -> During the weekend of 24/25 February were active
CT4UW/p - Periscoxe Castle Ref. DCFP C-064
CT1ETG/p - Mouros Castle Ref. DCFP C-120
CQ5EWA - Nazare Lighthouse [NPDXG # 12]
CQ5FMX - Nazare Lighthouse [NPDXG # 12]

W8CNL address changes -> Ray's address is going to change in March 1st.His
new address will be : 5 McKenzie Circle, North Augusta,South Carolina,

29841 U.S.A. . Ray is the QSL manager for 9K2ZZ , This address is valid also
for Derek (KC4ELO manager for 9K2ZC) and 9K2YY.

1295. AEA PK-900 FAX reception?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-01 00:00:00 UTC
From: Bill Crocker <billc@mail.rust.net>
Message-ID: <31375D1E.2F6E@mail.rust.net>
Source record: 38335

I'm currently learning how to use a Kenwood TS870-S and an AEA PK-900 for digital reception. I
have AEA's PC-PakRatt 2.0 for Windows, but that does not support FAX. AEA sells WeFax for Windows, to allow reception of weather FAX's. It this the best way to go, or are there better
alternatives?

Thanks, Bill Crocker

Hummm, never thought of this, I have a whole pile of 300baud/1200 baud
modems around here. Is it possible to use them for packet?

Thanks

Source record: 38198

Hello all, I am looking for the "em1200m2 emulator" (or something like that). I saw a packet bulletin a few days ago saying that this emulator can used along with the baycom program to run packet with the *hamcomm* interface. Anyway, I haven't been able to find the emulator mentioned above, and I would appreciate it if anyone can provide any information on where to find it...

thanks in advance,

Luis F. Orozco XE2MXU/N5UHB

My locasl computer geek informs me that it may be possible to route the audio output from my DX-440 through the soundblaster card on my pc. He claims that once the sounblaster has turned the analog signal to digital, I can then use it in various programs for decoding RTTY, CW, WEFAX and others. Does anyone have (or know where I can get) more information on this. Please return via e-mail. Thank you.

Les

I seem to have lost the notes I took (and posted on tcp-group) from a
couple of years ago that detailed the performance I measured with the
230 kbps radios and PI2 cards. However, I think I can summarize fairly
close to the truth from memory.

The actual throughput and latencies achievable is certainly a function of
a lot more than the raw channel rate and BER. I actually found that at
230 kbps, using a RAM disk rather than a hard drive made a significant
improvement with the 386DX/40s and MFM drives we were using at the time.

For a single 230 kbps link, I believe the best I ever did was an FTP
transfer rate of about 65-70% of the raw channel capacity. I achieved
greater than 18 kbytes/second end to end on a large file (I think I was
sending JNOS executables back and forth as fodder). I think that I got
almost 80% of the channel capacity when I slowed the radio channel down
to 56 Kbps. My interperetation was that the computer was having a hard
time keeping up with shuffling data around at the higher speed. As I
remember, I could only read/write the local hard drive at about 29
kbytes/second on the same hardware at the time.

Running end to end FTP across multiple hops, things scaled by the hop
number. I could get over 9 kbytes/sec with two hops and around 6
kbytes/sec with three.

It is certainly easy to *not* get these kinds of percentages though.
Even a single retry on a moderate length transfer will significantly
reduce performance. The above measurements were at 904.5 MHz where I
"owned" the channel and mileage would certainly be less were there
serious contention for the channel. TxDelay and other radio settings
have to be carefully optimized to achieve the best performance as well.

Latency is also somewhat variable, though RTT on short pings is on the
order of 15 milliseconds which is perhaps not more than double that of
the same hardware pinging over local Ethernet (3C501 cards so perhaps
this shouldn't be even considered Ethernet (:>))

From these and other measurements, I would say that up to as much as
about 80% of the raw channel capacity is *possible* with typical systems
but that it is probably not routinely achieved on most systems. With
9600 bps hardware(Tekks and TAPR modems with JNOS) I think I seldom if
ever have seen much more than 65%.

Subject: HF Packet. Is it worth setting up?

I don't understand why the following has escaped all you experts.
I'm not an expert, but it seems plain as the nose on my face.

Of course!! Pactor USUALLY does have much better throughput than HF packet! That's simply because only two stations are using the channel. You pactorites! (I'm one of them.) Haven't you noticed that

when a "bigger" station than you gets on "your" channel, he can knock you for a loop and you get no data transferred? You even get disconnected!

That doesn't happen so quickly on HF Packet. You just patiently keep retrying each packet until it finally gets through and you get your ack back.

BUT! IF THE HF PACKET CHANNEL IS CLEAR ... (like you expect it to be when running Pactor) you can pass data back and forth MORE QUICKLY THAN YOU CAN ON PACTOR. It can even seem like full duplex! Now that's
exacty why VHF/UHF packet is so successful! .... very little channel competition.

And how did we ever get into this bind that requires 10 packet QSO's to occur on one HF channel? No other mode has ever had to do this. Even reducing the current channel offset by half would probably work 90%
better and cram twice the QSO's into the same spectrum. I figure that about 2 packet QSO's can go on on one HF channel and get along respectably.
And those would be done and gone in about a tenth the time. So that would give us a 40 times improvement on the effectiveness of HF packet.
How's that for working the numbers? Probably a bit faulty. But the point is that what we are doing now with HF packet is rediculous and can be greatly improved tomorrow.

So you see, HF Packet is not inherently a bad mode. It suffers no more
than what VHF or UHF packet has the potential to suffer. The "line of

sight" bands merely "shelter" packet from the realities of life that bring criticism to HF packet.

A THOUGHT QUESTION: Why do we NOT run Pactor on UHF?? Hmm?

There are two reasons HF packet is getting all this "bad press." (You smart guys, stay with me on this...)

1. Not all stations can "hear" the station(s) transmitting. So they
do what the protocol tells them to do... "Scream when you think it's
quiet." Unfortunately someone around the corner is listening to "another drummer" and can't hear his "drummer" because the guy who
thinks it's quiet is screaming his head off.

2. Further, there's a much wider audience able to hear vastly more stations than is likely in the VHF bands.

The point of this, of course, is that VHF/UHF packet is "blessed" with not having to deal with such a diverse and unpredictably dynamic environment. But put a half-million potential packet users within range
of a UHF packet station and this wouldn't be quite the case.

Another point is that our packet protocol is ready for improvement. Now I'm not a "from-day-one" packet guru, but I guess we are probably talking about the "link layer" protocol.

It would seem we need a protocol that calls for all stations on a channel
to be recognized by all other stations who have "joined" as users of the
channel. If a station is attempting to "join" the channel and is not heard by some stations, the next one in turn who hears the station attempting to "join" then implements the "joining" by exchanging appropriate packets with the new station. Then the other stations, each in turn, would update their list of channel participants and acknowledge the update.

Note that this process would not mean that all stations are in a common
exchange of data, but all stations would be recognizing and respecting all exchanges of data. They would be linked in the effort to avoid collisions. Those linked for data exchange would be sub-sets of those

linked as channel participants.

Signals on the channel not participating in this new protocol would be

treated just as they are now. The benefit would be realized only when more than two stations on the channel use this protocol.

The overhead of such a polite protocol would increase slightly as more

stations join the channel. All stations would have to operate from an

identical list of channel users even though some stations might be hearing
only one in the group. Packet lengths might have to be adjusted downward
when more stations join and a limit on unsuccessful retries would have to
be lowered in order to optimize data transfer for all. So data between
any two stations would run more slowly as more stations join. I can think of at least one other downside effect (can you?) but at least data
would flow optimally, all things considered. I think even VHF packet could

benefit by such a protocol.

Summary:
HF Packet is being done wrong. It could be done just as effectively
as the
"better HF digital modes" by
A. expecting no more than two QSO's per channel or
B. enhancing the protocol to respect every user of the channel that
is
heard by any user of the channel.

What do you think?

Very 73 to all,

Dick - W7DHS Internet: dick@tmh.org

From: angell@northernnet.com (V.C. Angell)
Subject: Mac & CW

I hope this does not draw flames, but this seems one of the best places to
post this question I can develop a tremor suddenly and be unable to
continue a QSO in CW. I had stored a short message in my MFJ keyer
explaining my problem and sending my 73. I could always push the button to
send the message. I love CW and only operate there and VHF packet.

Last night my keyer died. It has had a series of problems ever since I
bought it, so I don't know if I want to fix it again. I have a Macintosh
computer. Does anyone know a program (I assume I will have to build an
interface, so any tips there would be appreciated too.) to send CW that
might also be able to store a short message for me?
Thanks.

I've experienced rates ranging from 3000 to 5900 chars per second
doing ftp between 2 JNOS sites using 56kb modems and Ottawa PI2 cards.
The rate is quite sensitive to the nos.ini file parameters. The
rate drops into the 500 to 900 range when going through a store and
forward JNOS router.

Hi Pete!
I guess you'll have to disable the comport from windows.
Go to: controlpanel\ports\preferences and disable the comport from
windows so windows can't find that port....
I' have done it myself.....i'm runing Winpack 5.4 + Bpq408a with a
simple baycom-modem.....and it works just fine!!

Good luck!

Agree up to a point. Its like watching paint dry!
Don't expect lively point to point Qso's.
BUT
Its an achievement to hook up to Moscow or Belgium on Packet, out
through their nodes and explore.
I did it on 20m from Shetland, where I live, to Colchester in South
England, on VHF to LONNY on London, out via wormhole to New York and
had a look around. Took Hours!
Sad Really!

Yes, I use it on my 940S for both the PK232 and the HAL P38 modems.
(separate 13-pin plugs for each) Pin-3 is fixed level output; Pin-4
is the ground shield for the audio output; Pin-11 is data input;
Pin-12 is ground shield for audio input; and Pin-13 is the PTT line.
The most important thing is to use separate shielded lines for each
pin-out .... tie them together to keep things neat .... and lengths
should be as short as possible. IT IS REALLY WORTH THE EFFORT!

Boy another paided voice for InterFlex.

Infact I believe and so does others here in Seattle area find their
LACK-OF support for their products worse then AEA. AEA has been of
more help the InterFlex .

They have not even answered E-Mail or faxes on upgrades to Versions we
HAVE paid for.

: Both offer KA-Node, 32K ram, PBBS, WeFax, Kiss and host mode to name a
: few. I know the KPC-3 will run off an internal battery, but other than that,
: what is the difference between the two?

The KPC-2 is a full sized full featured packet TNC and is designed for
home or digipeat site use. The KPC-3 is a small lightweight TNC that is
much smaller and lighter in weight than the 2 and will run about 6-12 hours
(depending on use) on a alkiline 9v battery or run on a 12v power pack.
Ive used it several times as a mobile TNC. I have owned both and like
them both. So you might try to take a look at the two of them and decide
which is best for your situation.

Hope that helps.

Subject: MFJ-43 Real Time Clock. How does it work?

Hi,

I notice that MFJ advertises a real time clock (RTC) unit for
MFJ and other TNC-2 compatible modems. Does anyone know how this works?
Is this in fact just a Dallas DS-1216? Does this mean that TAPR and MFJ
have already included code to read these devices? Or is there some other
method or code in there that we do not already know of? If anyone has
any clue as to how this thing works I would greatly appreciate it. I am
trying to build an RTC for my MFJ but I would like to use it with the
WA8DED host mode and do not know if the MFJ unit will actually work with
the WA8DED firmware. Thanks in advance.

Subject: PAKRATT or PKGOLD for PK232

Once upon a time, ranger@eskimo.com (Richard Berndt) wrote (at least in
part):
>
>Boy another paided voice for InterFlex.
>
Well Richard, I have to stand up for Interflex. You might very well
have some problems, but I want to tell you about my experience. See if
you can get this response from any other developer.

I bought PK-Gold for my own use at home here, and have been famously
pleased (around here, anyway) with the results.

Shortly after getting used to the program (no command channel, no stream switch, each QSO on its own screen, canned text, autoresponding to callsign,etc etc) I determined that the Only Way to do packet at Field Day was to run Gold. I stuck the appropriate exchange text into an "Alt Key message" location, a greeting into the connect message, and a nice closing blurb in another altkey message.

I was geared up.

This was Friday afternoon. Field Day started Saturday.

Friday night, as I was getting my stuff together, I decided to try it on the air. I changed the MYCALL from KB3JA (me) to W3MUM (the club) and away we went!

WRONG! Gold stopped operating. Wrong callsign, not registered!

I spoke a few words. Grasping at straws, I called the Interflex telephone number at 11:30 PM Friday night, got their recorder and begged, pleaded, and probably complained loudly (but I've forgotten that part) for some help.

I was crushed. All this prep and I can't use the club call. I was resigned to using Yapp. Yikes.

Guess what? They Called Me Back At Almost Midnight and explained the procedure, why they do it like that, and Gave Me The Code to use with the club call! On a Friday night! At midnight. Right before Field Day! (We got the 100 points, BTW. Piece of cake.)

Now I know midnight my time is nine PM their time, but that does not detract from their helpfulness. On a Friday night, to get anybody to respond at all is fantastic, but to get a return call And a solution at nine o'clock his time is just outta' sight.

That's the kind of people at Interflex. I recommend their products every time I get the chance.

They will always have my business, and I hope you give them yours.

Of course you can do that, when you have the software for it.
Some packages offer compression.
However, you will probably be disappointed with the results.

Text you type online can probably be compressed well, but is low in
volume anyway. When you want to transfer some file, you can use LHA
or PKZIP to compress it first, and the online compression will no longer
improve things.
Mailbox forwarding protocols also use compression already, so their
performance is not going to improve either.

To get to higher speeds, you will need to get an amateur radio license
and experiment with faster modems on UHF/SHF bands.

I like Winpack much better, with Paket 6.1 following close behind. Winpack
requires a 386 (at least 5.4 does) and Windows. Paket 6.1 seems to run
on anything. These comments are based strictly on VHF and UHF packet
usage.

Les

I seem to have lost the notes I took (and posted on tcp-group) from a couple of years ago that detailed the performance I measured with the 230 kbps radios and PI2 cards. However, I think I can summarize fairly close to the truth from memory.

The actual throughput and latencies achievable is certainly a function of a lot more than the raw channel rate and BER. I actually found that at 230 kbps, using a RAM disk rather than a hard drive made a significant improvement with the 386DX/40s and MFM drives we were using at the time.

For a single 230 kbps link, I believe the best I ever did was an FTP transfer rate of about 65-70% of the raw channel capacity. I achieved greater than 18 kbytes/second end to end on a large file (I think I was sending JNOS executables back and forth as fodder). I think that I got almost 80% of the channel capacity when I slowed the radio channel down to 56 Kbps. My interperetation was that the computer was having a hard time keeping up with shuffling data around at the higher speed. As I remember, I could only read/write the local hard drive at about 29 kbytes/second on the same hardware at the time.

Running end to end FTP across multiple hops, things scaled by the hop number. I could get over 9 kbytes/sec with two hops and around 6 kbytes/sec with three.

It is certainly easy to *not* get these kinds of percentages though. Even a single retry on a moderate length transfer will significantly reduce performance. The above measurements were at 904.5 MHz where I "owned" the channel and mileage would certainly be less were there serious contention for the channel. TxDelay and other radio settings have to be carefully optimized to achieve the best performance as well.

Latency is also somewhat variable, though RTT on short pings is on the order of 15 milliseconds which is perhaps not more than double that of the same hardware pinging over local Ethernet (3C501 cards so perhaps this shouldn't be even considered Ethernet (:>))

From these and other measurements, I would say that up to as much as about 80% of the raw channel capacity is *possible* with typical systems but that it is probably not routinely achieved on most systems. With 9600 bps hardware(Tekks and TAPR modems with JNOS) I think I seldom if ever have seen much more than 65%.

From: dick@tmh.ORG (Dick Mock)
Subject: HF Packet. Is it worth setting up?

I don't understand why the following has escaped all you experts.
I'm not an expert, but it seems plain as the nose on my face.

Of course!! Pactor USUALLY does have much better throughput than
HF packet! That's simply because only two stations are using the
channel. You pactorites! (I'm one of them.) Haven't you noticed that

when a "bigger" station than you gets on "your" channel, he can knock
you for a loop and you get no data transferred? You even get
disconnected!

That doesn't happen so quickly on HF Packet. You just patiently keep retrying each packet until it finally gets through and you get your ack back.

BUT! IF THE HF PACKET CHANNEL IS CLEAR ... (like you expect it to be when running Pactor) you can pass data back and forth MORE QUICKLY THAN YOU CAN ON PACTOR. It can even seem like full duplex! Now that's exacty why VHF/UHF packet is so successful! .... very little channel competition.

And how did we ever get into this bind that requires 10 packet QSO's to occur on one HF channel? No other mode has ever had to do this. Even reducing the current channel offset by half would probably work 90% better and cram twice the QSO's into the same spectrum. I figure that about 2 packet QSO's can go on on one HF channel and get along respectably.
And those would be done and gone in about a tenth the time. So that would give us a 40 times improvement on the effectiveness of HF packet.
How's that for working the numbers? Probably a bit faulty. But the point is that what we are doing now with HF packet is rediculous and can be greatly improved tomorrow.

So you see, HF Packet is not inherently a bad mode. It suffers no more than what VHF or UHF packet has the potential to suffer. The "line of sight" bands merely "shelter" packet from the realities of life that bring criticism to HF packet.

A THOUGHT QUESTION: Why do we NOT run Pactor on UHF?? Hmm?

There are two reasons HF packet is getting all this "bad press." (You smart guys, stay with me on this...)

1. Not all stations can "hear" the station(s) transmitting. So they do what the protocol tells them to do... "Scream when you think it's quiet." Unfortunately someone around the corner is listening to "another drummer" and can't hear his "drummer" because the guy who thinks it's quiet is screaming his head off.

2. Further, there's a much wider audience able to hear vastly more stations than is likely in the VHF bands.

The point of this, of course, is that VHF/UHF packet is "blessed" with not having to deal with such a diverse and unpredictably dynamic environment. But put a half-million potential packet users within range of a UHF packet station and this wouldn't be quite the case.

Another point is that our packet protocol is ready for improvement. Now I'm not a "from-day-one" packet guru, but I guess we are probably talking about the "link layer" protocol.

It would seem we need a protocol that calls for all stations on a channel to be recognized by all other stations who have "joined" as users of the channel. If a station is attempting to "join" the channel and is not heard by some stations, the next one in turn who hears the station attempting to "join" then implements the "joining" by exchanging appropriate packets with the new station. Then the other stations, each in turn, would update their list of channel participants and acknowledge the update.

Note that this process would not mean that all stations are in a common exchange of data, but all stations would be recognizing and respecting all exchanges of data. They would be linked in the effort to avoid collisions. Those linked for data exchange would be sub-sets of those

linked as channel participants.

Signals on the channel not participating in this new protocol would be

treated just as they are now. The benefit would be realized only when more than two stations on the channel use this protocol.

The overhead of such a polite protocol would increase slightly as more

stations join the channel. All stations would have to operate from an

identical list of channel users even though some stations might be hearing only one in the group. Packet lengths might have to be adjusted downward when more stations join and a limit on unsuccessful retries would have to be lowered in order to optimize data transfer for all. So data between any two stations would run more slowly as more stations join. I can think of at least one other downside effect (can you?) but at least data would flow optimally, all things considered. I think even VHF packet could benefit by such a protocol.

Summary:
HF Packet is being done wrong. It could be done just as effectively as the "better HF digital modes" by
A. expecting no more than two QSO's per channel or
B. enhancing the protocol to respect every user of the channel that is

heard by any user of the channel.

What do you think?

Very 73 to all,

Dick - W7DHS Internet: dick@tmh.org

From: angell@northernnet.com (V.C. Angell)
Subject: Mac & CW

I hope this does not draw flames, but this seems one of the best places to post this question I can develop a tremor suddenly and be unable to continue a QSO in CW. I had stored a short message in my MFJ keyer explaining my problem and sending my 73. I could always push the button to send the message. I love CW and only operate there and VHF packet.

Last night my keyer died. It has had a series of problems ever since I bought it, so I don't know if I want to fix it again. I have a Macintosh computer. Does anyone know a program (I assume I will have to build an interface, so any tips there would be appreciated too.) to send CW that might also be able to store a short message for me?
Thanks.

Subject: AEA PK12 ---- Problems

I have a problem getting a PK12 TNC to work with quite a lot
of packet program (Pakratt for windows, GP, etc)

It does however work with Hyperlog perfectly.

I only hjave experience of setting up packet modems, so any help / info
you could give would be appreciated.

Computer is a Perntium 90, 8Mb, running Win 95.
Gp does not work in Msdos prompt or Mode.

Please reply to u9313001@qub.ac.uk.

Thanks in advance, Alan.

Subject: APRS-PK900/AEA Packratt for Windows question

Do you run AEA's Packratt for Windows with a PK900 when you run APRS.
If so, can you tell me how to make sure the PK900 will beacon your
position after shutting the program and computer down? I've tried
entering the time beacon time on the APRS shutdown menu, changing the
Restore.TNC file, and setting up the BE time in the Windows program
but nothing works. I just want to beacon my position to other APRS
users when the computer is off.

I've experienced rates ranging from 3000 to 5900 chars per second
doing ftp between 2 JNOS sites using 56kb modems and Ottawa PI2 cards.
The rate is quite sensitive to the nos.ini file parameters. The
rate drops into the 500 to 900 range when going through a store and
forward JNOS router.

Hi Pete!
I guess you'll have to disable the comport from windows.
Go to: controlpanel\ports\preferences and disable the comport from
windows so windows can't find that port....
I' have done it myself.....i'm runing Winpack 5.4 + Bpq408a with a
simple baycom-modem.....and it works just fine!!

Good luck!

Agree up to a point. Its like watching paint dry!
Don't expect lively point to point Qso's.
BUT
Its an achievement to hook up to Moscow or Belgium on Packet, out
through their nodes and explore.
I did it on 20m from Shetland, where I live, to Colchester in South
England, on VHF to LONNY on London, out via wormhole to New York and

had a look around. Took Hours!
Sad Really!

Yes, I use it on my 940S for both the PK232 and the HAL P38 modems.
(separate 13-pin plugs for each) Pin-3 is fixed level output; Pin-4
is the ground shield for the audio output; Pin-11 is data input;
Pin-12 is ground shield for audio input; and Pin-13 is the PTT line.
The most important thing is to use separate shielded lines for each
pin-out .... tie them together to keep things neat .... and lengths
should be as short as possible. IT IS REALLY WORTH THE EFFORT!

: Both offer KA-Node, 32K ram, PBBS, WeFax, Kiss and host mode to name a
: few. I know the KPC-3 will run off an internal battery, but other than that,
: what is the difference between the two?

The KPC-2 is a full sized full featured packet TNC and is designed for
home or digipeat site use. The KPC-3 is a small lightweight TNC that is
much smaller and lighter in weight than the 2 and will run about 6-12 hours
(depending on use) on a alkiline 9v battery or run on a 12v power pack.
Ive used it several times as a mobile TNC. I have owned both and like
them both. So you might try to take a look at the two of them and decide
which is best for your situation.

Hope that helps.

Subject: PAKRATT or PKGOLD for PK232

Once upon a time, ranger@eskimo.com (Richard Berndt) wrote (at least in part):
>
>Boy another paided voice for InterFlex.
>
Well Richard, I have to stand up for Interflex. You might very well have some problems, but I want to tell you about my experience. See if you can get this response from any other developer.

I bought PK-Gold for my own use at home here, and have been famously pleased (around here, anyway) with the results.

Shortly after getting used to the program (no command channel, no stream switch, each QSO on its own screen, canned text, autoresponding to callsign,etc etc) I determined that the Only Way to do packet at Field

Day was to run Gold. I stuck the appropriate exchange text into an "Alt Key message" location, a greeting into the connect message, and a nice closing blurb in another altkey message.

I was geared up.

This was Friday afternoon. Field Day started Saturday.

Friday night, as I was getting my stuff together, I decided to try it on the air. I changed the MYCALL from KB3JA (me) to W3MUM (the club) and away we went!

WRONG! Gold stopped operating. Wrong callsign, not registered!

I spoke a few words. Grasping at straws, I called the Interflex telephone number at 11:30 PM Friday night, got their recorder and begged, pleaded, and probably complained loudly (but I've forgotten that part) for some help.

I was crushed. All this prep and I can't use the club call. I was resigned to using Yapp. Yikes.

Guess what? They Called Me Back At Almost Midnight and explained the procedure, why they do it like that, and Gave Me The Code to use with the club call! On a Friday night! At midnight. Right before Field Day! (We got the 100 points, BTW. Piece of cake.)

Now I know midnight my time is nine PM their time, but that does not detract from their helpfulness. On a Friday night, to get anybody to respond at all is fantastic, but to get a return call And a solution at nine o'clock his time is just outta' sight.

That's the kind of people at Interflex. I recommend their products every time I get the chance.

They will always have my business, and I hope you give them yours.

To: The Commission

COMMENTS OF TUCSON AMATEUR PACKET RADIO CORPORATION

Tucson Amateur Packet Radio Corporation
8987-309 E Tanque Verde Rd #337
Tucson, Arizona 85749-9399
(817) 383-0000

February 26, 1996

The Tucson Amateur Packet Radio Corporation ("TAPR") submits these comments in response to the above-referenced petition for rule making (the "Petition") filed by the American Radio Relay League, Incorporated ("ARRL").

BACKGROUND AND STATEMENT OF INTEREST

TAPR is a non-profit (501(c)(3)) scientific and educational organization with more than 2,500 members worldwide. It is chartered to engage in three principal activities: scientific testing and research into the development and

improvement of technological systems for use in the amateur radio service including, but not limited to, digital packet radio communications; research and testing of systems, hardware, and software for packet radio local area networks and computer network systems; and disseminating to the public the information obtained as a result of such research and testing.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. It grew out of a 1981 effort to design a packet radio Terminal Node Controller, or "TNC," that would be available to amateurs at a modest cost. From these initial designs emerged what is now the de facto standard in amateur and many commercial packet radio operations.

Today, TAPR continues as an international, membership-supported research and development organization for the amateur radio community. TAPR continues to develop new communications technology, provide kits for the amateur community, and promote the advancement of the amateur art through publications, meetings, and communications standards. TAPR also maintains a web site (http://www.tapr.org), which includes a page specifically addressing current amateur spread spectrum issues (http://www.tapr.org/ss).

DISCUSSION

TAPR generally supports the recommendations made by the ARRL in its Petition. Spread Spectrum ("SS") technology has not made great advances in the amateur radio service since it was first permitted in 1985, in part due to the fact that, by today's standards, the Part 97 regulations on amateur spread spectrum are extremely restrictive. In particular, the small number of fixed spreading codes permitted under Section 97.311(d)(1) inhibits the use and development of SS by amateur radio stations. TAPR believes that it is in the public interest, and in the interest of the amateur radio service, to change the rules for SS in order to accelerate the adoption of SS by the general amateur community.

TAPR also supports many of the specific recommendations made by the ARRL. First, TAPR supports the ARRL's request to modify Part 97.311(b) as it pertains to the unintentional triggering of repeater inputs. This section is redundant with other parts of the Commission's rules and, therefore, is unnecessary.

Second, TAPR supports the ARRL's request to delete sections 97.311(c) and (d), in order to permit SS emissions and spreading codes that are not currently authorized. Elimination of the rule that dictates specific spreading codes is necessary to facilitate further experimentation and to match the provisions allowed under an existing amateur service SS STA, discussed below. In addition, it would facilitate the use and adoption by amateur radio operators of Part 15 SS equipment and hardware.

Third, TAPR supports the ARRL's proposed change to 97.311(g), which would provide for automatic transmitter power control to limit the output power of an SS station to that which is required for communication, when more than one watt of output power is used. TAPR, however, differs with the ARRL as to just how simple this requirement would be to implement technically. While TAPR

agrees that technically it is simple to control the output power of a transmitter, it is quite another matter to make this control automatic and foolproof. If the Commission decides to proceed with this particular change to the rules, it should phase the change in over some reasonable period of time, in order to give the amateur community the opportunity to develop and deploy SS equipment that properly can meet this requirement.

While, as noted above, TAPR agrees with many of the ARRL's recommendations, it disagrees with a few of the proposals contained in the Petition.

In particular, TAPR differs with the ARRL with respect to the question of which frequencies should be authorized for SS emissions. In the Petition, the ARRL proposes that brief test transmissions of SS emissions be permitted only on those frequency bands in which SS emissions currently are authorized. TAPR believes that SS emissions should be allowed on all frequency bands covered by the SS STA currently held by Mr. Robert Buaas K6KGS (6m and 2m, in addition to the frequency bands currently authorized by Part 97). In addition, the Commission should allow SS emissions in the 219-210 MHz band, which was authorized for use by the amateur radio service after the Buaas SS STA was originally granted in 1992. Finally, the Commission should not impose any restriction on the length of time SS emissions are transmitted. Ample time already has been provided for the experimental phase of SS usage in the amateur service (five years of experimentation under the 1980 AMRAD STA and ten years under the current Part 97 rules), and it is now time to allow SS use without restriction.

TAPR also differs with the ARRL as to how station identification and documentation should be handled under a revised set of rules. The ARRL in its petition did not ask the Commission to delete sections 97.311(e) and 97.119(b)(5) of the rules, even though it questioned the practicality of the requirements set forth in these sections. TAPR, in contrast, recommends that the Commission delete these subsections of the rules. The interference and harm to the band in which an SS station is operating that would be caused by a requirement to use a CW identification outweighs the benefits that would accrue for monitoring purposes from the use of the ID.

As a result, the amateur radio community should be permitted to develop an approach for handling the necessary functions of monitoring and identification. TAPR already is working on possible resolutions to this problem and in the near future will be in a position to make a proposal to the Commission on this matter.

CONCLUSION

SS technology can provide many useful benefits to the amateur radio community if its use becomes more widespread and mainstream. In order to accomplish this, however, certain changes must be made to the Commission's rules governing the use of SS in the amateur radio service. By making these changes, the Commission will create a regulatory environment that will give members of the amateur radio service enough flexibility to develop innovative equipment and hardware employing SS technology.

For these reasons, TAPR urges the Commission promptly to issue a notice of proposed rule making to facilitate spread spectrum communications in the amateur radio service, as proposed in the Petition and as modified herein.

Respectfully submitted,

THE TUCSON AMATEUR PACKET RADIO CORPORATION

1307. Nos compiles

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-02 00:00:00 UTC
From: moore@teleport.com
Message-ID: <4hagtl$gi1@maureen.teleport.com>
Source record: 38345

Does anyone know where there is a ftp site with a array of
jnos/mfnos/whatever compiles?..I'm trying to find one that will run
in DesqView. I've heard that dumping the netrom part gains enough
space. It would be handy to find one that also had the
packetsdriver/BPQ interfaces.

1309. open forum for packet users

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-03 00:00:00 UTC
From: orrin@stinger.redshift.com
Message-ID: <4hd663$5sl@wing.redshift.com>
Source record: 38199

I've started an open forum for packet-network users who believe they've been treated poorly by some packet-network sysop (mainly the all-radio network).

By 3/6/96 i will have, besides my own 'complaint', the one submission i've received so far, posted on a web page.

To read more about this forum, go to my Web page:

http://www.redshift.com/~orrin

and click on the link "The Sysop Syndrome".

>
> I heard there is a VHF Mailing list.. I am trying to find out info on it..
>Any help is apperciated!!
OK, to subscribe post a message to:

vhf-request@w6yx.stanford.edu

With the body of the text reading:

sub vhf
stop

You will receive the infomation for the list then and be subscribed:
But the posting address is: vhf@w6yx.stanford.edu

The purpose of the list is VHF, primarily weak-signal, other then EME (which has it's own list). But VHF contests also get a great deal of attention. At times the list is a little high volume for me, but I just ignore it then

1312. Diode Matrixed TNC's - Help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-03 00:00:00 UTC
From: Carl Bergstedt <cberg@grayfox>
Message-ID: <NEWTNews.825900243.18118.cberg@napcom.svs.com>
Source record: 38202

Hello all,

Thought I knew a thing or two about connecting 3 or more TNC's using
TN 208b firmware. Had one node that used 4- MFJ 1270B's matrixed together
and it worked FB. Am now trying to use that same matrix at a node with
2- 1270B's and one 1270-C. The 2 - 1270Bs talk to each other but not to
the 1270C. I did all the things MFJ says to do to use the 1270C as a NetRom
/TheNet TNC, but no dice. Has anybody out there been sucessful in connecting
3 or more 1270C's together and how did you do it?

Any hints or checks to make surt that all is connected properly at the
1270C - voltage checks at the RS-232 port, etc.?

Any suggestions (other than starting with another brand of TNC's)
are gratefully appreciated.

73, Carl K9VXW

--
Hello Chris,

I use the 13 pin DIN on my and other 440S and 940S...it works very well.
I am using the KAM Plus ....I can switch digital modes on the fly without
having to play with any connections. Try it, you will like. Take care to
use a low heat solder iron, the 13 pin DIN if fragile...

Yes there is, Rich. KaWin is designed expressly for host mode Kantronics TNCs in MS Windows. Host mode is the magic bullet that opens up the dual port operation along with many other tricks of the Kantronics TNCs, and KaWin is the only Windows program that supports their host mode.

You may dowmload the FULL program (not a test version - but it does run with a nag meter until registered) right now from the KaWin Home Page below. GL es 73,

Stan

Source record: 38218

The Netherlands, March 6, 1996.
Hello dear reader,

NET/Mac v2.3.59 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Implemented 'deadlock breaker' of K5JB
- Make errormessages more helpful
- Enhance mailfile-handling for shared spool:mqueue folders
- Fix for 'smtp timer' command
- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
- wa2zkd mirrors UCSD's incoming on his Landline BBS. Ham's w/o ftp
can call 716-544-1863 or 2645.

NET/Mac will be uploaded to PI1HVH.AMPR.ORG, directory public/mac.

Adam PA2AGA e-mail: a.vangaalen@iag.tno.nl for mail to my office and BIG files

The modem was described by Glen Leinweber et al in Ham Radio, August 1988,
pp.10-21.

As far as I'm aware, the HAPN organization no longer exists.

I am not sure how the Maxar 80 varies from the straight Maxar, but Maxars are probably a fairly good radio for 1200 baud packet. I am in the process of converting a Moxy (very similar) for uhf, but haven't fired it up yet.. I would expect some work would be needed on the i.f. filtering for 9600, however. The manual should be available from your local Motorola service facility.

1333. Ext Power for BAYPAK modem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-06 00:00:00 UTC
From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <313DB2CB.5244@lanl.gov>
Source record: 38223

We are attempting to use a BAYPAK modem strictly as a modem, no packet involved. The enclosed instructions of course do not mention just how the unit gets its power from the serial lines. We would like to power up the modem without a PC being involved since all we are trying to do is detect a tone shift to produce the logic level change on the modem rx data output. We have tried applying +7 to 9 VDC to pin 2 of the DB25 connector but the modem refuses to work. It works fine when plugged into a PC serial port. We've also tried applying -9 vdc to pin 4 trying to emulate measured voltages while plugged into a serial port.
Has anyone else been able to successfully operate the BAYPAK modem from external non-serial power? Please advise, if so.

>uses compression routinely.

I missed the beginning of this thread but I'll chime in anyway. One thing
to consider... on a two way packet conversation where the text is something
like:
<kf5mg> Hi Gary. How's the 56k project comming along.
<ke4vz> Speeding right along. How are things with you.
etc....
where each string of characters between parties is short, your going
to get little, none, or Anti-Compression. Compression is mostly good when
you've got a lot of data (pbbs message for instance) and you know what it
is ahead of time. Play around with PKZIP. PKZIP a 1 line file of 40
characters or so and compare the compressed, .zip file with the original.
The compressed file is going to be 2 - 3 times larger.

Anyway... it's very difficult to get much compression on short strings
you'd see in a two way QSO. Using a faster baud rate is really the best and
only way to go in this case.

FreeWave Technologies makes 900 MHz bilateral power amplifiers that are better than HyperLink at lower cost. We hope to introduce our line of 2400 MHz amps in 60 days. Rest assured our amps will be far lower in cost than $3600.

Hello all,
I am looking for the correct codes to add to an address for a packett message
I want to send to Vienna Austria. I need the city and country codes to add
after the BBS callsign. Does anyone know the codes for Vienna and Austria?
If you do please send me a email note to the address below or post it on this
BBS. Thanks for the help.

>only way to go in this case.

Not necessarily. You're assuming that compression is done in isolation
for each frame. That does not have to be the case. Compression can also
be done on a session basis. Then the "book" represents only a small
overhead, and if you use a standard book, no overhead at all. It's not
the most efficient compression method, but it will work and offer some
advantage even for sessions with short interactive frames.

For those not familiar with code book, or dictionary, compression,
each codeword is more than 7 bits long. Lets say it is 12 bits.
That allows for a code book of 4096 elements. A 12 bit codeword
could stand for an individual letter, but more productively it
could also stand for a simple word like "the", or a common word
ending like "ing". So, for these examples, you'd transmit 12 bits
in lieu of transmitting 21 (actually 24 if using packet octets).
That's almost a 2:1 compression. A longer common word like "radio"
would show even better compression "gain".

Think about the vocabulary you need for a routine amateur contact.
Do you think you need more than 4000 different words? If you do,
you've still got the alphabet available for the ocasional odd
word.

1339. Help with Dallas DS-1216-C RTC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-07 00:00:00 UTC
From: daniel@pandora.lugs.po.my
Message-ID: <4hn6rb$v23@lantana.singnet.com.sg>
Source record: 38229
Cross-posted to: sci.electronics,rec.radio.amateur.digital.misc,comp.realtime,comp.robotics

Hi,

I recently purchased the Dallas DS-1216-C real time clock for use with one of my applications. Basically I took out the MOSEL 62256L which was in it and put the socket and replaced the SRAM. This is a Z-80 (TNC2) board and initially it appeared to work. Later however as I was trying out my own code, some of which did not work, the RTC seemed to stop working. Now the original code (not mine) which worked before, does not even recognize the presence of the RTC. My own code which now should work reads only zeroes. The battery part of it still works because the contents of the RAM is retained after a power down.

My question is this:-

1) Can this part be damaged through software (miscoding?)
2) Have I inadvertently set it in some "off" mode?
3) If so, what must I do to revive the chip?
4) Does anyone have the specs for the internal registers?

I am aware of the bit that sets the oscillator "off" but my own code specifically sets this bit to 0 and thus enabling the oscillator. Is there something else I should be doing? I did at one point accidentally set the oscillator off by writing a 1 to the osc bit but I later changed the code to write a 0 back to that bit. Any advise is welcome. I would also like to know where I can order this part cheaply. I am in the Singapore and cannot afford much. Thanks. Below is the code I use to read and write to the RTC.

: 212A's, I am wondering if one could use two 212A's (one for each
: direction) to emulate a 202 without any internal modification. This
: presumes that Bell 202 and 212A modems the identical with the
: exception that the 202 is half duplex only.

They aren't. The signalling (tone frequencies, and such) are very different between the two. Also, note that full vs half duplex isn't really an issue, as your radio is only half duplex.

Take a look around for a Baycom modem, or build one yourself (which is what I'm doing). I just got the receive side going, and I can finally SEE what all that strange noise is about!

G'day all,

I am a member of a three person project group. We are currently
doing our third and final year at uni studying Info Tech.

To complete our course we are required to undertake a project of
some kind. So we decided to see if we could get up and running a
fully functional tcp/ip network across the radio waves. Hopefully
establishing communication with the uni [and the rest of the world]
from our homes.

The network will be very small [3 nodes and the uni] and we have
a very small budget. [ie: our back pockets and what ever we can get
from the uni]

As complete 'try anything once' newbies, we are trying to use a normal
modem [slowspeed] + computer + walkie talkie combination [for trial purposes]
instead of the traditional computer + packet-modem + expensive tranceiver.
The computers we will use will be a mix of 486sx + linux, 486sx + msdos,
Mac{maybe] + Amiga 1200 [really streching it].

The uni will provide us with an IP number for our network, all we
have to do is get the thing up and running. This is proving very
difficult as, though our knowledge of datacoms is reasonable, we have
never used or have had experiance with amateur radio.

We would appreciate hearing from people that have experiance in
packet radio or have even attempted [successfully or not] something
along these lines. As we are keeping a record of our adventures in the
form of a few url's, we will be very happy to acknowledge and point to
people that have helped us [If you want]

Please send advice, criticisms, help, helpfull urls to Joe Parry
[djp@it.ntu.edu.au] I will endevour to reply and thank anyone that
lends a hand.

Thanks for you time.

>me <IO20754@MAINE.MAINE.EDU> wrote:

Hi Brian! Hey, if you're REALLY serious about a packet digi that is multi-protocol, multi-user, multi-speed and offers a NETROM Node as well, think about the possibility of getting a Kamtronics Data Engine and blowing the 1/2 megabyte EPROM with JNOS40xx(JNOS40 is especially designed for that Data Engine). That'll make both the vanilla AX25 packet users AND the JNOS or NOS fella's in your area as happy as a pig in mud. It'll handle BOTH full TCP/IP and normal AX25 packet protocols and offers a NETROM node (if NETROM is used in your area). It can be easily made to do both fast (19.200k and 1200 and/or/ 9600 radio baud rates and handle a number of different radios on a number of different frequencies and a number of different users all at the same time. SOME configurations (eg multi-frequency, etc., etc) might require you to hang additional TNC's off it in addition to its own internal TNC/KISS/G8BPQ/NOS etc programable functions. Its a programmable (!!!) TNC as opposed to a normal CONFIGURABLE TNC. Let me know about your views on this one.......... Be happy to answer your direct email if you want.

Just stick the device on a hilltop somewhere and wait for the local guys to explore all its features and possibilities. It'll keep 'em off the streets for a while........ Mavellous for interstate and intra state networking. Duz everything and some.........

Kindest regards,
Bob
TNC that allows you to update to new packet and protocol technology as your interests and resources develop.

TAPR Dayton Activities '96

TAPR again will be very active at this year's Hamvention. With the joining of the TAPR spring meeting with the ARRL Digital Communications Conference, TAPR Dayton activities now make up TAPR's Spring gathering. If you are attending Dayton, please take a gander at the following schedule. We have tried to improve upon last year and we believe we have. Come join us at the Digital Forum on Friday and then come have Dinner and a good time that evening at the PacketBASH.

Our booth will be in its usual place and activity around the booth is expected to be high, with the APRS SIG and the Sproul brothers showing the latest in Windows and MAC APRS at one end of the booth. It is rumored that there will be a APRS CD-ROM made available at that time. So -- if you are an APRS enthusiast, plan to stop by.

The dates for this year's Dayton Hamvention is May 17-19, 1996.

TAPR Schedule

Friday
12noon -- Exhibit Area Opens
1:00pm -- TAPR Digital Forum Begins
7:00pm -- PacketBASH
(Dinner, Prizes, SIG meetings, Banquet Speaker!)

Saturday
8am -- Exhibit Area Opens
6pm -- Exhibit Area Closes
9pm -- Informal SIG Meeting (TBD)

Sunday
8am -- Exhibit Area Opens
2pm -- Exhibit Area Closes

1996 TAPR Digital Forum (Friday)

The TAPR digital forum should be a great forum this year. If you have time at Dayton -- be sure to attend the meeting!

1:00 - 1:45pm
* Introduction to Digital Communications
Greg Jones, WD5IVD

1:45 - 2:30pm
* Making 56K Operations a Reality!

Barry McLarnon, VE3JF

2:30 - 3:15pm
* Spread Spectrum Technology and current issues in Amateur Radio
Phil Karn, KA9Q

3:15 - 3:45pm
* DAS and PCON and there use in Emergency Communications
Paul Newland, AD7I

3:45 - 4:15pm
* BBS Issues and Trends
Barry Buelow, WA0RJT

4:15 - 5:00pm+
* APRS Update and SIG Meeting
Bob Bruninga, WB4APR and Keith Sproul, WU2Z

1996 Packet Bash!

The 1996 "Packet BASH" sponsored by TAPR and the Miami Valley FM Association will be held on Friday of the Dayton Hamvention. The BASH will be moved this year to a very much larger site! So, if you were one of the folks that felt it was just too crowded for dinner -- you were not alone. The reason for the move was that TJ's Restaurant was just a little small for 1995. The event will be held at the AT&T site in Oakwood, OH (formerly NCR). The event will be catered and the dinning room holds about 400 people! So the more the merrier! Dinner space will be limited, so make your reservation early for dinner, so that the correct number of dinners can be ordered in advanced. To make the event even better -- we can stay a lot later than at the TJ's site last year, so we should have time for informal discussions after dinner.

* A buffet dinner,
* a raffle for some neat prizes,
* a great program,
* and lots of fun will cost approximately $20 per person.

We hope that this will provide an opportunity for packet and digital radio enthusiasts to have a great night out while at Hamvention.

The schedule of events for the PacketBASH is still tentative, but will look something like this:
1900 -- Dinner
1945 -- Welcome
2000 -- Keynote Address
2030 -- Raffle
2045 -- TAPR SIG Meetings

Talkin will be on 146.415 simplex.

For more information, send email to "packbash@ag9v.ampr.org" or stop by the TAPR booth at Dayton for schedule and map. The maps are currently available on http://www.tapr.org also.

Banquet tickets can be ordered from the TAPR office. Reservations made before May 1st will have there tickets mailed to them. After May 1st, tickets purchased will be available for pickup at the TAPR booth. Walk-up to the event will be accommodated as best as possible. There is limited space (in the way of food ordered) for Dinner. Amateurs who wish to attend the speaker and discussion are asked to arrive around 2000 (8pm).

1351. HELP-Packet drivers,Ethernet,AX25,JNOS/KA9Q Questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-08 00:00:00 UTC
From: Andy Walton <andrew.c.walton@dsto.defence.gov.au>
Message-ID: <4hofej$1ec@foxhound.dsto.gov.au>
Source record: 38241

G,day all,
Since I'm posting this to several unrelated groups, please forgive me if I appear to make things over-clear as to what I w=
ant to do.

I use several Pc's hooked together using 10Mbps Ethernet so as to run my ham radio packet software . My ham radio gear is out in a =
shed which is probably fairly normal for most hams, however is condidered slightly anti-social by the rest of the family. The idea i=
s to use a terminal inside the house,(read not anti-social!).

I use a "Baycom" style modem that does the audio encoding/decoding, and the ax-25 packet processing is done inside the host pc, th=
at is the pc is the TNC(terminal node controller). There are several programmes that enable one to do this namely BAYCOM using L2 as=
its ax25 interface, Graphic packet or TPK using TFPCX, or one of the many variants of KA9Q NOS using ax25.com packet driver.(ie JNO=
S)

I can currently set up the host PC as a TNC and run TELNETD, so I can telnet to it from another machine using NCSA Telnet(for DOS).=
The setup procedure at present is to run TELNETD on the host(using one of the ethernet packet drivers),and establish connection on =
the client,(that is the host keyboard and screen are somewhat replicated remotely, 24 lines, no colour or screen attributes). I then=
load up the ax25 packet driver on and start Ka9Q NOS on the TELNETD server and off I go. That is the host has two packet drivers =
running simultaneously, The ethernet driver for TELNETD and an AX25 driver for KA9Q NOS.

What I would really like to do would be to run the ax25 packet driver on the PC in the ham radio shack, have the ax25 packets route=
d up the ethernet cable to to remote PC, and run NOS on the remote PC by means of attaching an ethernet packet driver to it instead =
of the ax25 packet driver.

I have looked at the Simtel collection and there are two programmes that at first instance may appear to do the job but in fact won=
't. The first is PC Bridge abut that requires a specific type of ethernet card(Western digital) which I do not own. It effectivley c=
onfigures a pc as a bridge. The second program is PC Route which is an ip router. You can attach the packet drivers to it, However, =
it does its routing based on the i/p address embedded inside each packet. The only trouble with standard ax25 is there is no ip addr=
ess, so we have to rule this one out as well. Believe me, it don't work. What I THINK (???) I need is a bridge that can use packet d=
rivers.

I have never programmed in C, and am verrry rusty at assembler. Is anyone able to offer some suggestions as to how to bridge two pa=
cket drivers together on a PC ????? Would it possible to use KA9Q/JNOS as digipeater at the radio end and use KA9Q/JNOS at the remot=
e end using the AX25 packet driver for ethernet??

Any ideas would be welcomed

From: dpc01@www.gnofn.org
Message-ID: <4hop09$rj9@www.gnofn.org>
Source record: 38242

Thanks to all that reply:

Is there a site that is accessable via internet to retrieve current
packet bulletins, etc.; @WW, @ALLUS.

Would prefer to be able to d/l zipped files if possible to be imported
int a MSYS packet system here in New Orleans.

There are many packet systems available, but most don't have the buls
available in file form.

Thanks for any help and direction...

Danny/N5OMG

1353. Re: Baycom/PMP vs ?

Newsgroup: rec.radio.amateur.digital.misc

For Portable use, the PMP or Baycom modem is an ideal solution. Since most of these modems draw very little current (5-20ma), they steal there operating power from the computers SERIAL PORT (at least the BAYCOM modem does). Some of the older lap-tops had a problem powering external devices like this so I would check it out first.

These simple modems are just that, modems (1200baud, half-duplex, BELL202 compatible). They are brain-dead. This modem can be thought of as just one PIECE that has been lifted from a *REAL* packet radio TNC. The rest of the TNC functions of assembling/disassembling the packet info has to be done in SOFTWARE (as opposed to a TNC's hardware chips). It works very well, but depending on how much of a computer you have will determine how many SOFTWARE features you will ultimately have (like a mailbox, node, or full-blown BBS or NOS operation). An old XT compatible lap-top may not cut it...(oh it will work for the PMP software and *MAY* even work with the BAYCOM software if its fast enuff). A cheap modem like this could be built easily, and affordably and as the circuit is all audio stuff there is nothing critical about it. Even if you buy a TNC at a later date, the BAYCOM modem can still be a handy backup for travelling or troubleshooting or even as a loaner to other hams of your club. Many radio clubs over the years have sponsored a group building of this simple project for newcomers to gain experience in construction and debugging techniques. And they all walk away with packet ready system! Nothing beats using equipment you have built.

For a BAYCOM design, check out the DECEMBER 1995 issue of QST Magazine for the 'IMP' modem. A low cost BAYCOM modem, that CAN be upgraded (via appropriate drivers) for more features..Cheerio

When I was taken by a ham on Long Island last year, I can tell you that yes you can write and get the Post Office involved. You get a nice form letter from them and bottom line a few hundred lost via US Mail ain't big enough to make their list and don't expect any action. They won't even call or write the guy. 73 Robert

Hmmm Good Point...

Perhaps it would be covered by some inter-state fraud provision or some
such that would make it a federal crime (whatever that means these days).

Tekk can be reached at 1-800-521-8355. They will send you literature and tell you about local distributers. They also sell direct at full list prices as I understand it.

ah, I didn't write the original question, it was Aaron KA1VOA from Orono Maine.

By the way, I'm not the slightest bit interested in putting up a hidden transmitter lame simplex node. I don't care if you spend $10,000 on the latest wiz-bang tnc and software if you just 'stick it up on a hill' someplace as a simplex node you're wasting bandwidth and everyones time.

My only comment to the original thread was digi's don't work worth a hoot, so why even bother. If you are REALLY serious and would like to help, save the hugh amount of money you'd spend on that kantronics box, pool it with some other rich operators, and put up a digital repeater.

Ok you incredibly creative Hams out there, help me solve this one!

Since I moved, our Club station is too far away for a price-reasonable =
phone link, and touch-and-go for a 440 link, so ... how about the =
Internet?

The Club site is many times superior to my home site and I need a more =
reliable station QTH for missionary & emergency skeds & activities.

My home QTH is too low for a UHF or microwave link, though I could =
arrange a phone connect to another ham's hilltop QTH and a radio link =
from there ... but that seems too "old-tech".

If we can make a voice call and transfer digital data at the same time =
over the Internet, why can't I use the digital channel for control info =
& still do the voice?
I have no idea what sort of Internet account the Club station would =
need, but I'm sure we could find a way to do it ... I assume a Web site.

Sure, the voice won't be studio quality, but it should be communication =
quality.
The cable system and other methods are promising huge bandwidth access =
real soon.

Someone please surprise me and tell me it has already been done, and how =
... or that you are in the process of setting up such a link now. =
Help!

Yes. On Sept. 13, 1994 the Mail Fraud Statute was amended to include
"private or commercial interstate carriers". Federal Express and
others lobbied heavily for the bill, as they did not want to be a
haven for fraudulent actors seeking to avoid mail fraud prosecution.
The full text of the relevant section is set forth below:

Dwayne

Your friendly neighborhood air cargo lawyer
and ham (KC4POI).

Whoever, having devised or intending to devise any scheme or
artifice to defraud, or for obtaining money or property by means of
false or fraudulent pretenses, representations, or promises, or to
sell, dispose of, loan, exchange,alter, give away, distribute, supply,
or furnish or procure for unlawful use any counterfeit or spurious
coin, obligation, security, or other article, or anything represented
to be or intimated or held out to be such counterfeit or spurious
article, for the purpose of executing such scheme or artifice or
attempting so to do, places in any post office or authorized
depository for mailmatter, any matter or thing whatever to be sent or
delivered by the Postal Service, or deposits or causes to be deposited
any matter or thing whatever to be sent or delivered by any private or
commercial interstate carrier, or takes or receives therefrom, any
such matter or thing, or knowingly causes to be delivered by mail or
such carrier according to the direction thereon, or at the place at
which it is directed to be delivered by the person to whom it is
addressed, any such matter or thing, shall be fined under this title
or imprisoned not more than five years, or both. If the violation
affects a financial institution, such person shall be fined not more

than $ 1,000,000 or imprisoned not more than 30 years, or both.

This consists of an AEA CP-1 computer patch (radio modem), Vic-20 computer and AEA MBA-TOR cartridge that plugs int othe Vic-20. (or C-64) that is used along with the the CP-1.

you add monitor and you have everything you need for sending and receiving Morse, Baudot, ASCII and AMTOR.

I will also include the Kantronics Hamsoft cartridge that will allow you to operate Morse and RTTY.

rice is $125 and I will pay shipping. I have the moinitor for the Vic/Commodor computer for $15.00 but I do not want to pay shipping on that fella.

Trades? I would trade for the MFJ-451 or 451X

>As far as I'm aware, the HAPN organization no longer exists.

They are quite popular over here in the Netherlands.
Many BBSes and nodes include such a modem, and it is used on many links
that use crap commercial trxes that don't work well with a G3RUH modem.

Kits are sold by a couple of people. There even exist "duo-modems"
that combine a 1200 baud and a HAPN 4800 baud modem on a single board.

I think I can dig up some "Epson FX-80 printfiles" of the schematics,
if anyone can still print those.

I have heard that Dentron went out of business and that the original
owner then started another amp company called AMP Supply and that
it too went out of business. Assuming that is true, there are a
finite number of Dentron amps. I've owned one before and it worked
very well. But today, a problem could be replacement parts. Enough
were sold where one could get schematics easy enough.

From: web@vivanet.com
Message-ID: <4i18pd$g2@vivanews.vivanet.com>
Source record: 38162

The Rochester NY Area Packet Society (RAPS) has recently installed an APRS digipeater on 144.39. That frequency was selected to be compatible with nearby APRS activity in the Buffalo and Canada area.

We have very few users at the present time and I'd appreciate any coments APRS users have on how we can gain interest in APRS and increase the number of active users in our area.

Ah, an actual ricochet customer. How's the throughput, really? What
kind of bytes/sec do you get for ftp? And what does it *feel* like
during an interactive session? (IE does it feel like a 2400 baud telco
modem, a 9600 baud modem, a 28.8 modem, etc) And can you tell a difference
due to customer loading? (IE how consistent is the throughput?)

I'm very interested in this technology, a first hand user report would
be very welcome.

Gary

> >for data through unmodified radios (though there are problems with this
> >in a contending environment). So you aren't limited to just 1200 baud.

Unfortunately the HAPN 4800 baud modem will not work with unmodified radios. They will work with FM and PM radios though and do not require a transmitter modulator response down to DC that is required with 9600 bps modems. So they are less demanding on the type of radio you use than 9600. They can be made to work even with synthesised radios.

> Does anyone know where to find the HAPN 4800 Baud modems? I've seen them

1380. Network over Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-11 00:00:00 UTC
From: Phil Keller <philk@wco.com>
Message-ID: <3144D33B.2CB5@wco.com>
Source record: 38170

I have been asked, by the local Fire Department, to look into the possibility of using packet in times of emergency. They, like any government agency, are driven by forms and proper reporting of incidents, materials requested and consumed. What they would like is to be able to have an operator on a computer on the scene, enter the data into the proper electronic form and to have it printed out at the EOC.

If this were a wired network and I would have suggested that they simply use Windows-For-Workgroups with its ability to share resources and printers. This way they could simply specify the printer that is located at the EOC and print it out.

Since I do not have the advantage of wire between sites I was thinking that there must be a way to create a virtual network between the two sites. I understand that this will be slow, but hopefully what ever solution is implemented can support 5600 baud and that will help ease the pain.

What are my options and what do you recommend?

From: Jim Berry <basalop@eskimo.com>
Message-ID: <Do58Jp.LKK@eskimo.com>
Source record: 38174

Hi Tom,

I don't know if I will be of much help here but should get you going somewhat.

>- does pactor use selcall? or just my actual call?
Pactor uses the full call.
>- where do you look to start a pactor conversation, ie call cq or
>answer one?
Band conditions are pretty crummy but you should be able to find someone to talk to in the the 3600 3650 Khz area (80 meters) 7065 to 7065 to 7085 area on 40 meters. 20 meters in the 14065 to 14095 area. Now this is right of the top of my head. There are more exacting and specific areas but this should give you a 'ballpark' starting area.
>- I have heard some things that sound like pactor bulletin boards.
>how does one connect? is that what I am hearing when I come across
>(almost) endless repititions of a call sign, with no other data?
>
If you bring up a BBS (called MBO's) they will pretty much walk you thru a proceedure. Bye typing HELP they will tell you all about it. That endless string of calls you may be seeing is someone calling someone. An example would be if you were to call me you would send K7SLI over and over until my system answered.

I do run one of those MBO's and it, and others, can be good practice but unless you can rattle out the op you will have to talk to a machine. Even though, good practice.

If you are interested in more information let me know. I will try and think of a good nuts and bolts publication you can look at that would get you going.
>last, if anyone can point me to a good source for basic pactor operations

1387. EzPacket Ver2.0 for PMP/BayCom Modems!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-12 00:00:00 UTC
From: William Kresl <wmkresl@townsquare.net>
Message-ID: <4i2hmj$erg@spectator.cris.com>
Source record: 38177

Announcing: EzPacket Version 2.00 for PMP/BayCom

From: Bill-WB9BBC

I just received this post from Frank Domina, N9MXI, the author of the
EzPacket program for the PMP/BayCom modems. He can NOT be reached via
e-mail, so I am posting this note for him (read below). If you wish to
reply to him, it would be best to respond to THIS NEWSGROUP THREAD!

Frank wants some NETROM specs, if you can help in this regard I will
pass along his WORK FAX number (I 'X'ed it out in his note) if you drop
me some e-mail (make subject NETROM HELP).

Frank also attached his NEW EzPacket Version 2.00 program to his note
(size=70Kbytes). I will be happy to distribute this program for him if
you would:

o Send e-mail via INTERNET to ME (WB9BBC): wmkresl@townsquare.net
(Or, via PACKET RADIO: WB9BBC @KD9JK.WI.USA.NOAM)

o Make the SUBJECT line of the e-mail: EZPACKET
(so I can sort thru the mess)

o No text body necessary, but if you wish you can include
your name/call/QTH. Make sure YOUR internet e-mail address
is CORRECT (I hate bounced back mail).

o I will send out programs on FIFO (first-in-first-out), so
be patient if I don't get right back to you.

o The Program will be sent as a ZIP attachment (MIME), no decode
necessary. Just know where your program will go on YOUR system!
(I CAN NOT send the file as Packet RADIO mail, but I may send out
as a 7+ encoded file at a later date).

I haven't tried out this program yet, my BayCom modem is not hooked up.
If you have any comments, problems or bug-reports then please pass them
along. Cheerio!

Wm Kresl
WB9BBC (@KD9JK.WI.USA.NOAM)
wmkresl@townsquare.net
Delavan, WI USA

Hi,

I saw a news posting of yours on the 'net and wanted to give you some releated information. Due to the firewall here at work, I cannot post back to news articles; therefore I am mailing this directly to you. Feel free to post this if you wish...in fact, I encourage it; HOWEVER, PLEASE DO NOT POST MY E-MAIL ADDRESS BECAUSE IT IS A WORK ADDRESS AND WE ARE STRONGLY DISCOURAGED FOR USING E-MAIL FOR PERSONAL USE. Giving it to bizillions of HAMs may generate more personal e-mail traffic than my employer will excuse. THANKS!

I am the author of EzPacket, a PMP and Baycom modem TNC software package. It works through the serial and parrallel ports. It is much, much better than the PMP software. In fact, I have gotten letters from people around the world that really like its user interface and features. Of course, everything is personal taste, but heck, who am I to argue with exper users! (hi hi) If you have a PMP or Baycom modem, I urge you to try my software. Also, any feedback you have would be appreciated -- especially if you find bugs, which I hope have all been eliminated.

(Bill, FYI, EzPacket was originally a small college project, NOT high-school. I'm almost 34 years old, and have been a software engineer for the past 13 years. Also, a correction to my call, it is N9MXI (not mxT). Thanks for metioning EzPacket though! Good to here from you again.)

There is no charge for the software and it may be distributed freely as long as all 3 files in the ZIP file are kept together. If someone wants a user's manual, they have to send me $5.

I am attaching the latest EzPacket revision. I just released it yesterday. You are #2 and #3 to receive it. If the attachment doesn't get to you in tact, you should be able to retrieve EZPKT200.ZIP from a BBS at (708) 980-9544 in a couple of days. It takes the BBS sysop (N9MHT) a day or two to accept and make new postings available on the BBS. That BBS is in a suburb of Chicago, near my last residence. I am now in Atlanta, but I am keeping that BBS the "home" for EzPacket.

I do have a question that one of you may be able to help me with. The NETROM implementation in my software is basically the same as was in the PMP software and it seems to be incomplete. Do you have any specifications on NETROM so I can fully implement it? If so, please FAX it to me at work (XXX) XXX-XXXX. If not, can you point me in a direction that I may find it? THANKS!!!

Also, one of these years, if I ever get a chance, I want to add TCP/IP support to EzPacket, and maybe binary file transfer. Any thoughts or recommendations or discouragements or whatever??? Especially regarding binary protocols?

Regards,

Frank Domina, N9MXI

|> of the ax25 packet driver.

Have a look at PC/Flexnet. It does just what you need. It has a driver for Baycom modems and may use PD drivers to connect
two computers via ethernet. Furthermore it can emulate TFPCX so you still can use GP.

Have a look at http://www.th-darmstadt.de/diverses/afthd/flexnet

Do you want to use packet radio to send messages to your non-packet friends or even to your non-amateur friends? You can - by sending NTS (National Traffic System) messages. The article at the URL below explains how to do it.

Article URL: http://www.idir.net/~medcalf/ztx/nts.html

From the home page at http://www.idir.net/~medcalf/ztx/ you can link to other articles mostly about digital modes. The articles may be reprinted in amateur radio club newsletters provided that credit is given to the author.

The site also contains diagrams for wiring radios to tncs.

In Command mode, did you type INT KISS then RESET to switch it to KISS mode. Is the TNC working with a regular communication program before you switch to KISS mode. Make it work with a simple com program first then turn KISS mode on then run Jnos. If you are not even sure the cord is good, you are in trouble. Only mess with Jnos when you know your computer and the TNC are talking. You HAVE to do that as the TNC is never in KISS mode at turn on.

Good luck and 73

I recently aquired a Tempo MPP-1 TNC and am interested in starting a dialog with any other Tempo/AR1200 owners.

Specifically, I am looking for the 5-pin Mini-DIN-like TNC to radio connector. A call to Henry Radio was of little help as they no longer distribute the unit, nor do they have any more cables. I have been able to find the female part of this connector locally. but no one has ever seen a cable like this that I can find in the Phoenix area. Does anyone know of a supplier for these connectors?

Also, I only have the basic manual and would gladly pay a small fee for a copy of the technical manual/schematic. Even a complete breakdown of the MPP-1's unique commands would be helpful.

I am aware of the birdie this unit causes on 145.01. I'm aware there is a cure, but what is it?

I understand the 80 mm paper rolls are difficult and expensive to find. Does anyone know of a good supplier for this paper? I'm also aware, as I used to work in a print shop, that it is quite possible to buy wider thermal paper rolls and cut them down with a band saw. Has anyone done this?

Generally, I am interested in any tidbits, dirt, amusing anecdotes, unusual uses, etc. of the Tempo MPP-1/AR1200.

Please respond via personal e-mail.

My first suggestion would be to move to the recommended nationwide APRS frequency of 145.79 but you ruled that one out for some reason. Please reconsider the impact of not being on the nationwide channel!

Second, put in an HF receiver so that you can see and repeat position reports for stations over the entire world. Recommended HF frequencies are listed in the readme files.

Third, with spring (violent) weather coming, be prepared to send weather reports over APRS manually. If you practice, you'll know how to send snowfall reports in your sleep by fall. If you link a TNC to a weather station, you can automate the reporting process from locations where you don't want to stand during a thunderstorm!

Fourth, get active with fixed reporting points along with just a few vehicles for local events like marathons, bicycle races, boating events, holiday parades, and even amateur foxhunts. You don't need to be in motion with a GPS receiver to use APRS. Spectators enjoy watching the racers' numbers appear on screen as they pass by a specific turn or a water stop along the course. If you can also show the exact moving location of an ambulance or "sag wagon," well done, but it's not essential.

Last, and most important, stay in touch with other APRS users and the software authors, both Bob WB4APR and the Sprouls. Share your ideas that turn out good, squelch the bad ones, and broadcast your experiences. Amateur radio is, after all, a hobby of communications involving a large number of people around the world.

Hi!
Has anyone had any experience with using a Drake TR-22 for 1200 baud packet? We've got a couple in the Air Force Academy cadet club that aren't doing anything, so I figured we might as well set one up for packet and free up the radio we're using now. Unfortunately, we have absolutely no documentation for it, and therefore don't know which mic pins are which. Anybody out there that could help?

Thanks,
Russ KI7FL

I'm sorry, but I disagree 100 percent. I have a Baycom modem here, and have run Baycom 1.4 and 1.5 on it many times, and while it is "acceptable" it has always been very much INFERIOR to *any* packet activity I have done on ANY TNC...beginning with the original TNC-1!

Since 1988, when I started in packet, I've owned and operated:

TNC-1 (still use it today)
KPC2
KPC3
KAM
MFJ 1270
MFH 1278

It's true that some of the early TNC's *did* have birdies that could land near a particular operating frequency, but this problem has (as far as I know) been solved for quite some time.

I ahve always experienced far greater throughput when using a TNC instead of the BAYCOM modem and software (which I have tried rpeeatedly, over several months, for several years).

BAYCOM and PMP have their merits...they are the most inexpensive way to get into packet (unless you find a used "basic" TNC)...and the terminal software is nice (though there are a slew of commercial and shareware programs now that do as much and more than BAYCOM...check out the shareware versions of eSkay Packet (SP) for example).

1407. Trouble returning to command mode with MFJ-1278

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-14 00:00:00 UTC
From: edward@winternet.com
Message-ID: <edward-1403960006080001@ppp-66-14.dialup.winternet.com>
Source record: 38051

I'm currently borrowing a friend's MFJ-1278, and have been able to try it out only on 2m packet.

The unit will power up, communicate with my term program, and receive incoming packets. However, whenever I connect to another station, the 1278 locks up after a successful connection. I can't get it to return to command mode (I have confirmed that the COMMAND character is Control-C), nor will it send outgoing packets in converse mode.

I've tried resetting the unit by removing the lithium battery, but still experience the trouble.

I'd appreciate any advice about what's going on and what can be done to fix the trouble.

Hostmaster will run fine in a DOS window.

For something more elegant, try KaWin, a true windows program. You can
download it to test from:

http://www.mutadv.com/kawin/

It's a bit expensive -- $79 at last check, but it does a lot of nice stuff.
I've seen references to other high-end Windows software for Kantronics
(KaGold, I believe), but I haven't tried it.

Well Gary, most make their own cables...its very easy...you only need be
of entry level skill with a soldering gun to make cables, but, there is
a place that makes custom packet cables that are well built, and look
very nice. It is;

Universal Radio
6830 Americana Parkway
Reynoldsburg, OH.
(614)866-4267

Just call 'em up, tell them what rig and TNC you have, give 'em the money
(credit card number), and they will send it to you when their done. It
usually takes less than a week, and I believe the typical cable is about
$14.00.

Take care.

That almost rings as a clever ploy! Simply saying, "It isn't a very
good mode for HF," sounds to me like, "Please don't use the
'HF packet channels' for QSO's. Stay out of the forwarders' hair."

I agree that HF packet protocols can be improved. But right now
... TODAY... if it weren't un-gentlemanly to use the other
"teleprinter"
channels, HF packet could use the HF spectrum more efficiently than
even Pactor. (And I love Pactor.) But pactor will not tolerate
more than one QSO on the channel. Maybe that's the big reason it's
a favorite when you really think of it.

Actually, I would think pactor would be one of the better modes
for forwarding packet traffic. HF packet is great for QSO's when the
channel is not bonkers with users.

Hi Folks,

Does anyone know if there is any packet software for receiving 2m DX cluster that will run on a 4 year old Atari Portfolio ie 8086 with built in DOS, 128k RAM and up to 128k RAM data memory card, RS232 port. I have one doing nothing and it would sit very nicely by the main rig. It appears to survive the 400w linear and doesn't generate hash. I just need appropriate low memory usage software for a suiatble 1200 TNC.

Regards

Duncan
G4ELJ

The problem with being on the cutting edge is that you occasionally get sliced from time to time....

Actually this little radio works pretty good unless you have an RF
saturated environment like a mountain top site. Most of the problems
people have is that it is a crystal controlled radio and therefore
needs to be aligned if you change crystals and want it to work well. I
have several of these running and the work well. I can get better than
.65 uv SNAD on the receiver with my service monitor. I recommend it.

Check this out...
****
* GOVERNMENT THREAT TO INTERNET *
****

The FCC is considering a petition, filed March 4, to exercise JURISDICTION over the INTERNET and make usage of Internet Telephony software ILLEGAL.

This is a serious threat to the Internet! The FCC is moving along at an astounding pace. They have already issued a Public Notice for comments, which are due April 8, 1996. After this, they will be "considering" what action to take.

The bureaucrats must be stopped NOW, before it is too late! Let your elected representatives know your opinions.

for more info...check out the URL:

1423. Problem with PK-232 (or the op)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-15 00:00:00 UTC
From: white_hae@ccsua.ctstateu.edu
Message-ID: <1996Mar15.150407.1@ccsua.ctstateu.edu>
Source record: 38063

I just acquired a PK-232 with 1988 ROM, TAPR modem disconnect, and
TAPR DCD state machine upgrade.

Comms between the radio and PK-232 appear to work fine; monitoring
RTTY & CW on another radio showed no transmit problems, and the
tuning display behaves normally when tuning in a RTTY or CW sigs.

The start-up screen is displayed on my PC when the PK-232 is booted,
and I can send commands to the PK-232 from the PC. However, no
received info from the radio is forwarded to the PC. A breakout
box on the PK-232's serial port shows commands moving fine but
no radio sigs.....and as I said, the tune display on the PK-232
shows that a true RTTY sig (etc) is being received.

I'm stumped. Is my hamfest bargain FUBAR?

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

From: Horace Ory <ory@olympic.net>
Message-ID: <4ide9i$32f@oly.olympic.net>
Source record: 38069

I'm using the 1200TH2 (1200 modified by Alinco for 9600 bps)
with TXDelay of 20 (200 msec) and it works well. If I try smaller
TXD, performance degrades, and at TXD=15 (150 msec) it just
doesn't work. The 9600 bps mods used by Alinco are the same as
publically available for the 1200. I think I have them around
somewhere, so if you can't find them, let me know and I'll send
them.

1431. Re: Baycom/PMP vs ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-16 00:00:00 UTC
From: wmkresl@townsquare.net
Message-ID: <4idnmm$ncr@spectator.cris.com>
Source record: 38071

Here's my two cents: I have built ALL of my own BAYCOM/PMP modems
for my personal use as well as for other folks. They all used the
TCM3105JL single chip modem. This chip has a critical RECEIVE BIAS
(RXB) voltage that MUST be set properly for good receiving of packets.
This DC bias voltage is best set using a trimpot voltage divider, as
opposed to the STANDARD BAYCOM modem design of a fixed voltage
divider. Many 'REAL' TNC's still use this modem chip, along with the
fixed bias. These modem chips will receive packets poorly whether in
a homemade PMP modem, or a brand new KPC-3 TNC if the bias is not
correctly set (see TI's own data sheet on these chips). A very rough
bias set point is +2.65vdc.

I wrote a more "TECHNICALLY-CORRECT" tune-up method that
appeared in the DECEMBER 1991 issue of 73 magazine that
describes making this adjustment with some test software, scope,
and loopback cable. Properly adjusted, the cheapie BAYCOM/PMP
modems can go head-to-head with any other like fitted TNC (perhaps
surpassing them) in the receive area.

I agree about the ESKAY SUPER PACKET program, it is GREAT! However,
no longer a shareware program. If you want some more fun, try the NPF
PMS software on top of the G8BPQ packet switch with the TFPCX driver
underneath. A full FBB compatible BBS/PMS/NODE/DIGI for your pleasure!
Cheerio!

I'd try for $100 US and settle for $90 US.

1434. AEA Fax III--please help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-17 00:00:00 UTC
From: arden@teleport.com
Message-ID: <4ihcbs$1ru@nadine.teleport.com>
Source record: 38074

Hi! I just got AEA Fax III and I�m not satisfied with the quality of the faxes I�m receiving. I seem to have strong signals but the images generally show lots of noise�particularly horizontal lines. The quality is not any better (and perhaps even worse) than I got when I used the old PK-fax (circa 1988) through my AEA PK-232. Also, I�m unable to get an acceptable greyscale sat picture (yes-auto greyscaling is on). I�m hoping that one of you out there can help.

Setup:

Computer: DX2/66 VLB-SVGA video, 16 megs Ram, 1.2 gigs HD
OS: Win95 (I run AEA Fax III in fullscreen mode
AEA Says this is OK under Win95
DOS mode is no better)
Radio: Kenwood TS 450 S/AT
Antenna: Cushcraft R-7

Configuration: I have comm cable connected directly to the serial port on the computer. The AEA demodulator is between the far end of the cable and my PK-232 TNC. The PK-232 is being fed HF audio via the TS-450 Aux2 which is connected directly to the radio2 input jack on the PK-232. This makes "RX-in Audio 2" jack on the PK-232 hot with audio so I�m using it as output to the fax demodulator.

I�m wondering if this is the problem. Am I putting too much of a load on the Acc2 audio output from the TS-450? I�ve also tapped that line to provide audio to a Tono Communications terminal (so I can use the computer for packet clustering while running RTTY). However, I have this tap on a switch and see no difference even whether the switch is off or on. Also, the digital miniscope included in the AEA Fax program seems to show a fairly high audio level to the demodulator. It�s supposed to run on only 100 m volts and the Acc2 puts out 300.

Any ideas?

TNX in advance for responding.

Does anyone out there know how to properly construct a cable from a KPC-3 to an Azden PCS-5000? Does it require any resistors, etc? Any help would be greatly appreciated ... I've been trying to cable this TNC and radio for months!

Ouch! It's been a while since I've played with this stuff, but one nano-
second sounds awfully tight for TTL. You might want to consider ECL or
some of the newest CMOS stuff to get edges that clean. I'm sure there are
others in the group who can tell you exactly how.

1437. Baycom/PMP vs ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-17 00:00:00 UTC
From: quans@mbh.ORG
Message-ID: <2694113187@p18.f101.n323.z205.mbh.org>
Source record: 38077

ne: Joe Burnhams comment on the Baycom modem, I myself have had 10 or so differe
nt TNc`s. A pk232 a Pk88 a BSX a TNC2 and mfj multimode and lots of home built
modems including the good old trusty baycom board!.

I tend to disagree with Joe on the baycom not being as good as a `real` tnc
For a start if you look at a circuit diagram of the BAycom modem and a TNC
you will note that the modem part of the TNC(2) is almost exactly the same!.
All use the tcm3105 all have the circuit configuration the same. The TNC
has on board software in host mode only once in KISS mode your using the
basic modem anyhow rather like running a baycom board under a driver aka
tfpcx ax25 etc etc.

The difference between the baycom and the TNC2 for example is negiable once
you look at it, in fact set up correctly the baycom modem can be much better
to use than a standalone TNC. You have no power supply you have just to
connect to the PC and thats that!.

You can run more than just the baycom programs, I for one have run amonge
others FBB, JNOS, TPK and a host of other packet programs, concidering
ALL thise metioned either needs an external driver under KISS or W8DED host
mode.

rdis is my opinion, I use at the moment two TNCs and have just made a baycom
boa
for a friend it kicks hell out of any of my TNC`s~~

See ya.

I too have used Ricochet at work and when in the Bay area. We don't have Ricochet in our neighborhood, however. I find that throughput feels pretty much the same as accessing the Internet through my 28.8 modem at home (which usually connects at speeds between 21.4 and 26.4 kbps). In other words, throughput for us generally felt like about 20k to 30kbps. Your throughput will vary depending upon your location within the network and the number of other users, and what everyone is trying to do (e.g. file transfers) We have a big review of Ricochet at our web site. You can find it in the "Archives" at
http://www.accessone.com/~vbook/hronline.htm
(find the archives at the end of the feature stories).

Hi!

VY1BB, Brian Butler, has posted a lof of interesting stuff about
the Yukon Amateur Radio Association at:

http://www.klondike.com/yara/yara.html

If you are planning to travel through the Yukon this summer and
are bringing amateur radio along for the trip you might want to
see what we have to offer for 2 Meter Repeaters and Packet Radio
capability in the Yukon. We think you'll be surprised.

The Yukon Amateur Radio Assocation is a small group of dedicated
Radio Amateurs interested in forwarding knowledge and skills of
amateur radio in the Yukon. YARA provides communications at lots
of public functions as well as provides communications for the
Yukon Territorial Government's Emergency Measures Organiztion in
times of civic crises. We are an important link to the outside
world in such times.

Ever wondered why you don't hear too many VY1's in contests and such?
Come to the Yukon Amateur Radio Association's Home page and get the
answers from some of us whose e-mail addresses are located there.
We'll tell you about most anything regarding amateur radio in the
Yukon. WE ARE LOCATED IN CANADA! Just in case you didn't know.

73,

Kel, VY1CA

P.S. We do packet too! There is lots of good info on the Yukon
Packet Radio Network available also.

Message-ID: <4iikv8$ake@olympus.net>
Source record: 38084

I purchased one of these little beuties and threw it on the service monitor. I do not like them. The published sensitivity .25uv is a dream. I do not consider .65uv acceptable and my unit turned out 1uv. It also has a problem in tx in that the crystal starts far off freq and comes on freq after about a second. Not my idea of a good data radio. I doubt if this hog would work at 9600 since it is marginal at 1200. Go buy a dr-1200 you will be happier since it is a real radio.
good luck 73 Bill

About all I can offer is that a nine-pin RS232 cable is required to connect to the PC...a twenty-five wire cable is a known problem causer, but not this case to my knowledge. It rather causes distorted transmitted signals. Perhaps there's more to it than I realize.

Does your b.o.b. show + and - sigs on the interface 2 and 3 pins? Have you checked to ensure that the jumpers are set for PC rather than Commodore signalling? Seems I recall something about TTL vs RS-232 data levels...

Sorry to be so vague... Good luck!

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@stat.com

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@primenet.com

*** Remember, this has to be left justified

Internet: david@stat.com FAX: +1 (602) 451-6135
WWW: http://www.stat.com/~david

JC> Thanks and 73.

WISP runs OK without registration, it's not crippled. But at the start there's
a posting that suggest to pay AMSAT for phase 3d and then you get a key.

Try //ftp.amsat.org, usually works OK here

Hello All.

I am looking for any newer versions of this sana II device driver, as I
have some problems with this, the AmiTcp 4.2 commercial and my A4040.

I have V1.0Beta-19950416 as of Aminet, and would like to hear from
anyone in case newer versions should exist. There is a supported setup
in AmiTcp for X.25, and this is really the ax25 driver. Bootpconfig has great
problems with the driver, when it is trying to launch it. Also I cannot
get the driver to map to odd SSID's in the ax25 header. I would like to
avoid details in case I'm using some outdated version..

Btw,
Have anyone heard from the author of ax25.device lately? I have tried
several emails for some time, and one snailmail. None has bounced back..

Any information would be appreciated.

I have read posts here and have asked this question to others. Now I ask you!

I will buy a TNC in the next few days and would like to make the right choice
the first time. I will want to use RTTY, Pactor, Amtor, Packet and maybe CW.
I run Win95 and have a IC-736 HF rig and an Alinco DR-110 VHF rig. I would
like to hear from you as to your opinion of a good TNC and why you like it.

My top three choices now are:

MFJ-1278B or 1278B/DSP (no Win software that I know of)
KAM+ and KaWin software
PK-232MBX and Packratt win or PKGold

I have not listed the TNC in any order.

Thank you for your help!

I have the same radio and TNC. I had to make my own cable. If you
call MFJ they will mail you a schematic. I think the parts costs
under $5.

1459. Re: C64 to Knwd Interface

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-19 00:00:00 UTC

Source record: 38001

I haven't this to control Kenwoods, but I have used the C64 to control
various radios remotely via interface devices, such as Collins KWM-380
and Icom IC-
2AT. Your application should be easier to interface than a "486" since
the C64 already input/outputs TTL levels via the userport whereas the
486 normally has to use an RS-232 to TTL level translator (which is all
the the Kenwood "computer interface" consists of).
One glitch that may prove troublesome is the CBM "ascii" has caps and
lowercase letters reversed from normal ascii.

Hi Folks.

I need to be pointed in the direction where I can find a 56k modem
(already built or kit is fine) and a UHF radio that can handle this
type of xfer.

I'm sick and tired of 1200 baud packet and I'm ready to upgrade.
Any suggestions would be welcome.

1461. Baycom & Laptops

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-19 00:00:00 UTC
From: Bill Rhodes <rhodes@raster.kodak.com>
Message-ID: <4imq4v$lrm@kodak.rdcs.Kodak.COM>
Source record: 38003

I am attempting to run Baycom software with an older NEC Multispeed Laptop (AT, I believe). The software seems to have a problem running the serial port. When one types a command, e.g. [:c w2...] the rig transmmits one burst and the line below the transmit window switches from "QRV" to send and locks up in that mode. First opinions were that the modem was getting insufficient voltage, however, further experimentation with the modem disconnected entirely shows the same mode of operation (if I run the same experiment on a 286 desk top that I have the s/w operates normally). A recent opinion is that the Baycom s/w needs type 65500 uarts to operate correctly and that some laptops do not have them. Anyone out there have any experience with this kind of problem? Thanks for any help and 73 from WB2JMX

1462. SPG-NEWS for Windows Debut!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-19 00:00:00 UTC
From: kizawa@mb.infoweb.or.jp
Message-ID: <4in4kd$ro@news.infoweb.or.jp>
Source record: 38004

Hello.
Thank you very much for having my message read.
I will introduce the software which I developed today.
Packet radio network correspondence e-mail system SPG-NEWS for Windows was developed this time.
SPG-NEWS is e-mail software characterized in the operation environment by GUI.
Each other of FWD-RBBS and the message of W0RLI and the F6FBB type is forwarded.
There are two kinds of communication methods of the following.

1.Method of exchanging message according to forwarding protocol
2.Auto-pilot function to connect automatically at reserved time, to read message and mail of specified genre, and to transmit message which I wrote.

The operation environment is Windows3.1 or Windows95.

At first, an English version was scheduled to be released from the Japanese version release within three months. However, the execution file was made common.Therefore, SPG-NEWS was able to be released in the world simultaneously.
The manual and the help file of an English version were prepared.

The home page of SPG-NEWS was established in undermentioned URL.
Please see by all means.
"SPG-NEWS V4.0" & "SPG-NEWS Demo program" can be down-loaded on this home page.

I own two of them. For what they are, they work well at both 1k2 and 9k6
speeds. The receiver is not going to ever see .25 uv sensitivity, but
until I hooked it up to the service monitor I didn't have any problems :)
I run mine on a network here one serving as the 2m 1k2 port radio into a
amp w/45 watts out. Runs day in and day out w/o a problem. 73 Mike

1465. New Web Site for Northeast Regional All Hazard Conference

Newsgroup: rec.radio.amateur.digital.misc

The Massachusetts Emergency Management Agency has established a Web site.
The latest information on the Northeast Regional All Hazard Conference,
June 26-28, 1996 in Boston can be found there.

The URL is http://www.magnet.state.ma.us/mema

Please direct your telephone calls on this conference to Mr. Kevin Tully,
Area 1 Director, Massachusetts Emergency Management Agency,
(508) 640-9500 Fax (508) 851-8218.

=========
On a side note.... I am looking for hams that are either ARES or RACES
afiliated who might be interested in manning a Amateur Radio booth at this
conference. We are looking for those who might be willing to show portable
packet operation as well as APRS. Also looking for those that may have
setup portable repeaters to be brought into a site and used in an
emergency event.

Please contact me if you are willing to come and join us, show off your
skills as an emergency communicator and fabricator! Please e-mail me at
this address or at tstader@i2t.com.

Don't worry about it--it's done in the chip. Unless you are making a
HDLC chip simulator like PMP and Baycom, then it's about as necessary
to know as the 386 microcode. If you're really curious, grab any data
book at the local community college. You'll find it fully described.

Check out the grapes homepage on http://www.mindspring.com/~bobm/grapes/grapes.html or siskin for a ready built one, but hold onto
your wallet. You can transmit
with a micowave modules transverter, but the biggest problem is that the 56k sig is about 75k wide at it's 30dB points.
Plus you need a suitable card to dive the modem with.

You seem to forget what you bought, Bill. This is a *MFJ* radio.
You're responsible for final tuneup and quality control, that's
why it's so cheap. It's a good basic design, and it can be tweaked
to meet its specs.

It is possible to create the equivalent of a cassette port
on the SX-64. You will need a C-64 schematic and an SX-64
schematic. You run a few wires from your connector of choice
to the SX-64 cpu board. It is a pain to do it, but it can
be done.

From: jayt@comtch.iea.com
Message-ID: <4ipbsh$j4q@krel.iea.com>
Source record: 38014

There is no difference in earlier/later models of the P38 from Hal that I
am aware. The only difference is in software which is one of the most
important parts of the HAL. Changes in the code are available from HAL
or from the IDRA ftp site.

ftp.iea.com /public/adrs/p38 or thru the http://www.iea.com/~adrs
IDRA Website.

The P38 comes with a communications program and there are several others
available as well.

Thanks for reading this.

I've noticed that my Kantronics KPC-9612 "goes deaf" if I exit JNOS and
then restart. The unit is still receiving data, and has not been
powered off, but the trace screen in JNOS shows nothing until I do a
tip sesion, then drop the KPC-9612 out of KISS mode and put it back in.

The KPC-9612 is about three months old.

All suggestions welcome.

Hi,
I have a KAM and like it very much. I enjoy working VHF and HF simultaneously so the dual port is for me. I do NOT have a KAM+ because I upgraded to the enhancement board which essentially does the same as the +. I've checked KAWin and although it's a nice program, if I was to spend the money on registering software, I'd go with KAGold. It offers conferencing, CDRom interfacing (for callsign lookup) and the easiest multipathing (hop from node to node) that I've experienced on any software. I must point out that I'm not using that software at this time but did test a Beta copy. I'm currently using PaKet 6.1 which is shareware and it is great.
I hope I've helped .....

What a sterling Idea!! ;)

It would work! That solves a lot of problems on 40. Actually
I think we FSK folks could cope there almost as well. Our throughput
would be almost as good as CW. ;)

But the broadcasters might complain about all those crickets and
birdies. They are more of a problem to the audio audience because of
the power duty cycle and the endless rythm of the FSK signals. :(

>Any suggestions would be welcome.

GRAPES may have some kits on hand, see Bob Merit's homepage,
www.mindspring.com:80/~bobm/.

And PacComm has been advertising the new W&T model for a few months
now. I don't know if they're actually shipping yet. Check Dale
Heatherington's homepage, www.wa4dsy.radio.org:80, for info on that
and also for information on the original modem. Note, you'll be
going across a live 56 kb link when you access this page.

The RF modem *is* the radio. What you need is a *transverter* to
put it on the UHF band of your choice. For 70cm, Microwave Modules
and SSB Electronics are your choices, though you can get kits from
Down East Microwave or even Hamtronics instead. At 222 MHz (or 219 MHz)
Maple Leaf Communications offers a Microwave Modules clone that
works fine.

You also need a digital interface card. The Ottawa PI card, or the
Gracilis card, will do. Bob's homepage has links for this stuff.
Remeber you need someone else within range to buy a set too, else
you'll have no one with which to play.

> PK-232MBX and Packratt win or PKGold
>
>
>I have not listed the TNC in any order.

If you want plug and play, scratch the MFJ off your list.
There are problems getting it to do all the things it claims
to do, the DSP is just a front end bandpass filter, and of
course there's the famous MFJ lack of quality control too.
(It's not a lost cause, but you'll likely have to treat it
as a "project" unless you're lucky.)

If you'll *never* want to upgrade the TNC with external modems,
(satellite, higher speed terrestrial, etc), get the KAM+. It
offers the most features out of the box. It's a true dual port
TNC, and it's the only one that offers GTOR. But it offers no
way to upgrade to higher speeds or different modulations. (As
far as I know anyway.)

But if you might want to run satellite, or move up to 9600 baud,
then get the PK-232. It can be fitted with an external modem
using a kit put out by TAPR.

Another option would be the new AEA DSP box. In theory, it can
be upgraded to do any of the common modem chores with just a
firmware update. AEA says in their ads that they'll be supporting
all the new modes as they come out. Whether that will actually
happen or not, we'll have to wait and see.

If you can do without packet and CW, then the HAL P-38 DSP card is
a great choice. It gives you Clover, Pactor, AMTOR, and RTTY, with
promises from HAL for support of other modes to come. It works very
well. Packet is almost a lost cause on HF, and CW isn't a machine mode,
so their lack isn't a real hardship unless you'll be operating VHF

packet. Then you might be better off buying a plain cheap TNC just
for that use in addition to buying the P-38 for HF.

I see I haven't narrowed your field for you. You'll have to make
the final choice yourself based on what you perceive as your own
needs.

>book at the local community college. You'll find it fully described.

I guess I am sort of building a _really_ poor man's TNC.
I hope to build a _light packet TNC for balloon use. I presently send
station IDs and telemetry in morse, but I'd like to use a 68HC05 and a
1200 baud modem chip to send the data in packet format.

The BASIC Stamp that presently runs the balloon would send data to the
68HC05 and that chip would format it as a packet and send it to the
modem chip. Audio from the modem chip would go over the voice
transmitter.

I've been looking at the specs and nothing looks too hard, except that
I can't find any data on calculating the checksums. I know that CRC
checks aren't trivial, so I need the info.

If I can't find it, I'll send the packets with checksums of 0000h, but
then people will have to set their TNCs to accept bad packets and I'd
rather not make them do that.

What kind of data books should I look for? Any titles?

Thanks, and 73,
Dave, N9LTD

Hi! I've had exactly the same problem with my very recent purchase of a KPC9612 v6.0 and enquired around and found that Mr Kamtronics has, indeed, a Web page and with a URL that points to an email address to their service dept. Ain't you lucky!!!! Anyway, the problem in my case was that after I had issued the mandatory INT KISS (or XKISS) and the RESET command to get the TNC's CPU to re-read the Eprom and the cmos configuration, the goldarned thung just wouldn't go into KISS mode properly. Turned out in my case that I was trying to disable (deliberately!) the transmit function on the 9600 baud port whilst leaving the t'other going. In other words, I had turned XMITOK off on the 9600 baud port but had left the 1200 baud XMITOK on as I wanted it to. The thing didn't like that and refused to behave itself by going into KISS properly. Karl, the main man in the Kamtronics Service Department sent me some email which set me on the right track. I had, at his request, emailed him a copy of my JNOS's Autoexec.nos file and he sent me back a copy of his. Turns out that Karl is, like me, a keen JNOS fan. Everything works O.K. now.

Try this URL:- http://www.kamtronics.com.

Watch for the URL that points to their email address which I THINK (????) is service@kamtronics.com

They reply very quickly.
Let me know the reason for your particular problem. It might help me avoid further hassles..

Best of luck,

Kindest regards,
Bob.

Maarten,

The way I understand it, "Now does GPS", means the tnc can interface with a GPS enigne and by using a program called APRS someone can see another person doing the same and there location. By doing this one can track objects such as cars, planes, and boats and watch them move in realtime on a map. All this transmitted by a tnc, radio, and GPS engine.

I hope this helps.

Hello,

In this months CQ I noticed that many packet modem ad also contained
the caption "Now does GPS"!

As a SWL-er with an interest in RTTY and other digital modes I was
wondering what this GPS does in the context of packet modems.

Would it be possible to retrieve your exact location by using one of
the modems, the correct receiver (Scanner radio?) and the correct
antenna, and probably a piece of software?

This would be great. Please could you let me know what they mean with
"Does GPS" and waht else I would need to create my own little GPS
receiver.

Are you running Baycom Version 1.5 on your laptop? I too had that lockup problem both with my AT laptop as well as occasionally other desktop systems. In my case and in most others that I've heard about, switching to Version 1.4 completely cures the lockup problems. Email me for details on getting 1.4 if you don't have it already. IMHO version 1.4 is much more robust than 1.5.

>and it is great.

Right on Dick, at least from my perspective. I have really enjoyed my Kam
after running many different TNC. I run a 2M/40M gateway here and it does a
bang up job. I also enjoy Pactor/Gtor with the Kam.

I also agree on KAGold. I have tried every terminal program I could lay my
hands on. KAGold it by far my favorite. It is a pit pricy, and that held
me off for a long time. I too ran PaKet 6.1 -- a truly outstanding bit of
shareware. However, when my "ship came in" by way of a Christmas financial
gift I knew just what I wanted to do with the cash, and moved over to KAGold.

No slam on other TNC's or software, but I highly recommend the KAM with
KAGold (or at least PaKet).

73 all...

KAWIN NEWS

KaWin 6.36
Kantronics to distribute KaWin
KaWin FTP Site closure
KaWin News mailing list issues

Version 6.36 of KaWin, available now from the KaWin Home Page, is just a maintenance release with a few, very minor, fixes. But, due to problems with my mailer, many people missed the announcement of version 6.35, with support for the Buckmaster Hamcall CDROM.

Also, I am very pleased to announce that Kantronics will be packaging KaWin on diskette with every TNC and TNC-upgrade. This is the same shareware KaWin that is available from the KaWin Home Page and will increase the distribution of KaWin several fold.

All files that were previously available from the KaWin FTP Site have been consolidated in the KaWin Home Page. If you do not have Web access and had previously relied on FTP access to these files, send me email to that effect and we'll arrange to get them to you.

I have purged all addresses from the KaWin News mailing list that have had delivery problems. If you did NOT receive the email version of KaWin News announcing KaWin 6.36 and would like to be on the mailing list, please subscribe by email request. To add your email address to the KaWin News mailing list, send email to stan@mutadv.com with the word SUBSCRIBE in the subject line. If your email address is modified in any way by your host or gateway, please include the correct address in the body of the message. Thanks.

Message-ID: <199603221617.IAA00504@UCSD.EDU>
Source record: 38041

I've been attempting to set up two Midland 13-509 220 rigs for 9k6 using TAPR modems. The transmit portion, adding a varator diode to the crystal oscillator stage works well. However, the eye pattern out of the discriminator (before the deemphasis ckt) looks TERRIBLE on both radios.

The TAPR modems have EPROMS which apparently can be coded for different receiver audio responses. Unlike the G3RUH style modem, there are NO jumper settings available with which to adjust EPROM response, nor do the TAPR modems I have, contain ANY documentation on this topic.

Has anyone in the group had success with using TAPR 9k6 modems with the Midland 13-509?

If you have Web access, take a look at
http://www.mindspring.com/~bobm/

and especially the link to "Barry VE3JF's Hi-Speed Options",
http://hydra.carleton.ca/articles/hispeed.html

>I'm sick and tired of 1200 baud packet and I'm ready to upgrade.

Go for it! 1200 baud may have been reasonable in the early 80s, but in
the days of ISDN and cable modems it's ludicrous. We hams are supposed
to be _ahead_ of the rest of the world...

Open the radio up and follow where the wires go.

The mic cable will have a shield on it.

I have one that I bought from a guy who was using it on packet, but with
low power (one to two watts) and a receiver that is not very selective,
I would say forget it. Unless you happen to be very close to the BBS or
other station you want to work.

Good Luck,

Cliff K3LL

1511. How to handle power in routing

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-22 00:00:00 UTC
From: pecampbe@mtu.edu
Message-ID: <4iuu5j$d2n@snickers.mm>
Source record: 38101

I'm playing around with algorithms before I go and actually implement anything so here's where I'm stuck...

First, I'm looking at implementing a packet radio system crammed into a Part 15 unlicensed band. With care, I think I can get a couple miles out of it which is all I need. The link itself will be able to handle up to about 140Kbps which is a far cry from microwave megabit speeds, but not shabby otherwise.

The modems will be using a single channel and I have considered using the MAC outlined by Phil Karns (listen, send packet request, receive go-ahead, then send packet at power specified by the intended receiver).

As far as I can tell, this system is upgraded a bit from CSMA type packet networks (listen, then send away and hope you don't cause a collision) by using the send request/go-ahead messages as additional protection to the packet. The power control also helps.

But going from the details of the link layer to the transport layer (I've also considered the various collision free slotted and unslotted protocols), how does one determine how to route?

When one doesn't consider the possibility of power control and/or congestion, then routing is simple.. compute the shortest available path (passing through the fewest number of nodes).

But what about congestion? And what about power control? Under low congestion for instance, then you would want to follow the first method which means boosting your power levels to send the packet as far as possible (while simultaneously colliding with intervening nodes). But under high congestion or with a local area of congestion, one wants to route around the congestion or decrease power while going through it to limit the amount of interference generated by your message.

Are there any algorithms or analyses or anything in this area? Or am I looking for something that doesn't exist?

1512. Re: Baycom & Laptops

On 19 Mar 1996 17:16:15 GMT, you wrote:
>I am attempting to run Baycom software with an older NEC
>Multispeed Laptop (AT, I believe).

I ran BayCom software very successfully for many years with all sorts of BayCom modems and computers... A year ago I bought a used IBM ThinkPad 500... BayCom exhibited all the symptoms that you described... After the first transmission it was stuck forever in "Send" mode...

I thought that I could no longer use my BayCom modem on trips unless I purchased a new computer... Then I discovered a program called MUBAY... (That stands for MultiUser BAYcom.) It is written by a chap in the UK and is an EXCELLENT program... You can use it as a terminal program without registering it... However if you register it, it opens up multiple features, the greatest of which is a multi-user mailbox and mail gathering capabilities... The best part is Jon Welch, the author only charges $20 to register... The worst part is he wants it in British Sterling... I highly recommend the program... He has a home page on the Internet... I can't remember what it is... If you can't find it by searching for MUBAY, then post back and I will find it for you...

> A recent opinion is that
>the Baycom s/w needs type 65500 uarts to operate correctly and
>that some laptops do not have them.

This is false... My laptop has 16550's and it still would not run...

MUBAY uses TFPCX as the replacement for BayCom's L2.EXE program...

The problem seems to be a major defect in the L2.EXE program... BayCom authors do not understand how some serial ports work... The TFPCX author does understand...

You CAN run your BayCom from ANY laptop...!!!

>jumper settings available with which to adjust EPROM response, nor do
>the TAPR modems I have, contain ANY documentation on this topic.

Let me clarify something here. Unless every receiver in the system
has the *same* distorted response, neither the TAPR nor G3RUH compensation
system can be used to compensate for receiver response. What these systems
do is predistort the *transmit* waveform, and receivers with different
responses will see that waveform differently, IE it might perfectly
compensate one receiver while making a total hash of what a different
receiver decodes.

I'd suggest using this predistortion feature *solely* to compensate
for *transmitter* distortions. If every transmitter in the system
is compensated to a common output waveform, then any given receiver
will see the same sort of signal regardless of which transmitter emits
it. *Then* you can compensate these individual receivers to operate
properly with that waveform by modification of the individual receiver's
circuitry.

That's the only way to get a consistent functional network.

Sorry this doesn't directly address your question, but I figured
it needed saying.

Gary

1514. Low power output with PK-232 and TS-440

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-23 00:00:00 UTC
From: dcole@weaver.guilford.k12.nc.us
Message-ID: <4ivtl0$iir@inxs.ncren.net>
Source record: 38104

Greetings!

I've got a "late-model" PK-232MBX connected from Radio 1 to ACC 2 on a TS-440/AT with an AEA cable. I'm currently experiencing two... phenomena:

1. With R151 (resistor associated with the Radio 1 Jack on the '232) clipped, the best I can do is 25-30 W. Clipping the resistor is recommended by AEA specifically for '440 radios connected in the above fashion.

2. Apparently, when the '232 keys the '440 through the ACC 2 jack, if a PTT mic is connected, it's keyed, too.

Can/Will anyone help diagnose/explain what's going on? I can key up with the PPT mic and fully drive the transmitter at/near 100W, so I don't believe it's an overall output problem.

Thanks and 73 de KC4WEJ,
Derrick

I agree with Gary and as I said before TUNED properly they work great.
I gather you have a DR-1200. Unfortunately, the DR-1200 and its 9600
baud cousin are nothing more that standard audio rigs with some slight
modifications to disable the standard audio (the 9600 version might
have widened filters - I hope so). It is a synthesized unit with a
horribly long txd required to work properly. The MFJ works great at
9600 with a 60-80msec TXD IF you tune it up (which is real easy even
with out a service monitor). I wouldn't use the radio in a high RF
enviroment but then again there are not many others I woudl either.
Check out the lastest issue of QST. They have a comprehensive review
of the MFJ this month. They also had a review of the DR-1200 a while
back and gave it a less then passing rating.

>internet via packet radio?

Sure, but it depends on the services provided by your local TCP/IP network.
Here in Colorado, there are entry points into our backbone from 2-meters
and 440 at 1200 and 9600 baud. There are a couple of 9600 baud wide-area
coverage repeaters on 440 for easy access. A Linux-based Internet
Firewall/Gateway allows the local guys to have access to the Internet -- the
Firewall keeps non-hams off the radio side.

> Also, can I use 56k in all areas and get on the
>net or only in areas with a network gateway such as Grapes or the other state
>nets?

Only where there is 56K access to the local network. Our Northeast Colorado
56kb access point is under construction.

For more info on the Northeast Colorado TCP activities, see:

HI Ed,

I use the KAM+ and Hostmaster II program. The Hostmaster II does not
have all the features of KAGold, but it is not in the same price class.
I am very happy with my choice. I use the KAM+/HM II combo ever day
and it works fb. It is nice to be connected to the DX cluster, see
a spot on HF digital, activate that mode, work the station and never
change your display..very nice feature.

I recommend the KAM+ because of it's capability to run HF and VHF/UFH
simultaniously...the software is your choice. Good luck.

received my new pakratt pk232-mbx friday and she stopped working saturday. seems i issued a reset command to restore the factory original settings and now shes braindead. i power-on and do not receive the boot-up screen. lights come on and she goes right to baudot mode but nobody is home.

is there a way i can do a hard reset on this unit?

any help would be appreciated.

>
>$300.00

How come you want to sell the P38? I have one and although it is not
practical to operate in Pactor mode as yet due to apparently serious
problems that HAL has not been able to help solve yet, it sure is nice
for Clover and especially great for rtty, far outperforming any modem
I have ever used on rtty.

>(quality control) problems with this modem, especially the earlier ones?

I had earlier posted a comment to a ham wanting to sell his P38, and I may be the only ham in the world who has this problem, but I have never been able to use it in the Pactor mode for serious use. It almost always will lock up during the switch over from one station to the other. There have been a few exceptions, but it occurs about 80% of the time for me. It is very embarrasing since I always have to preface my contacts with " I am using the HAL P-38 and it often locks up so please kill everything and start over when and if this happens". Naturally a lot of my contacts just wont fool around with this constant rephasing and attempting to connect and get some thruput. It has been very very upsetting to me that my first experience after waiting almost three years to save the money for a good modem has resulted in complete disaster. It is possible that I have some quirky problem at my end causing all the difficulty, but you kind of wonder since when I ask other p38 users how the Pactor operation works, they will say it works great until they then admit that they dont really operate pactor with the p-38.

I wouldnt mind hearing comments from other P-38 users who have great success or problems either way.

>looking for something that doesn't exist?

You assign each possible route a metric determined by recent history
of round trip times for other packets. The one with the shortest round
trip time becomes the preferred route. To seed this process, you assign
routes randomly to the first n packets, with n being the number of
possible routes, and use their history as the metric. When your selected
best route's performance drops some selected percentage, you do another
n packet set of trials and reselect for best route.

This should be done on a router by router basis, not on a connection
by connection basis for best results. That lets you take advantage of
other traffic on the system to provide route metrics. If you like,
you can add some statistical multiplexing into the process by randomly
assigning an occasional packet to a not recently used route. This
spreads the loading and gives you updated route metrics. If additionally
you allow the routers to pass their metrics to each other, more deterministic
routing decisions can be made.

Hi, Dave -

The AX.25 Frame Check Sequence is a 16 bit CRC. It is usually
implemented using a lookup table. Get AX25DRV.LZH, the xNOS packet
driver for BayCom-type modems by Pawel Jalocha. The 8086 assembler
source code is included and contains a good example of using a
lookup table to calculate a 16 bit CRC. I'm told it can be found at
ftp://ftp.ucsd.edu/hamradio/packet/tcpip/baycom/. They may have it
as a .ZIP file, not sure.

I also have a public domain QuickBASIC example by Lyle Jensen called
CRCTEST.BAS. It's about 5 kB; I can send it to you as email if you
want. Drop me a line.

Have fun - 73

Source record: 38123
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

A friend of mine went to the Tulsa hamfest this weekend, and saw
a demo by SkyWalker Data Systems. They sell a decoder for the NWS data
transmissions. I hadn't heard of this, and it sounded interesting to see
what I could find on the Web. It was quite a battle with the several search
engines, but I finally did track down the main page. It is:

http://www.nws.noaa.gov/oso/oso1/oso12/document/emwin.htm

There's a schematic and protocol description. Basically it is 1200,N,8,1
and the components are a TCM3105 and a MAX232. Here locally (Oklahoma
City area) the data is transmitted on 169.025.

I think this is a great application for home use. How many of us really
listen to the NWS audio? The data products will be of much higher value.

I notice that Kantronics has released their new Amateur Paging upgrade to
the KPC-9612. It might make a great combo to transmit Alerts via
alphanumeric pagers (people chasing storms). I can see the need for voice
diminishing, and the greater throughput and reliability that can be
achieved. I'm sure there are many more applications for both of these
systems. I'm thinking about making a clone of the NWS idea and transmitting
all the BBS messages as files. A person would never have to log on to
a BBS ever again. Anyone could just tune an old scanner to the frequency
and use the software to store each file. You could then read the junk once
a month a keep up with the Morse Code debate :-)

Here's the two companies with products:

1535. 33cm band and spread spectrum tech

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-24 00:00:00 UTC
From: tony.blake@stpaul.ncr.com
Message-ID: <tony.blake.38.002E5C85@stpaul.ncr.com>
Source record: 38125

I have obtained some wireless LAN adapter cards. The have an effective throughput of 2Mb/sec. The use spread spectrum on a center frequency of 915 Mhz. The card has a power rating of 0.5 watts, which is under the legal limit of 1 W for unlicensed devices of this kind. My original plan was to recrystal the cards to an appropriate HAM band and use them there. However, I've run into some interesting aspects and questions for which I don't know where to find the answers. I'm hoping someone here may be able to help.

1) Looking back on my study materials from when I was studying for my ticket, it looks like USA Amateurs have priviledges in the 33cm band, from 902-928 MHZ, all modes. My first question is, do we still have them?

2) It was my understanding that amateur digital communications must contain the callsign of the sender. A local HAM here said the rule is much stricter and that amateurs must use the AX.25 protocol ONLY, for digital communications. Is it true we are limited to only using AX.25 for digital communications?

3) Essentailly these cards operate from 904 MHZ - 926 MHZ. I have been told that this is too wide of a channel. What is a "channel" and is this true?

Those are my specific questions, however I'm essentially looking to find the official rules for digital communications in the 33 MHZ band is, and whether or not the FCC limits me to only using the AX.25 protocol.

Thanks in advance for your help.

Bung it in the spool directory of your TNOS root, e.g. /tnos/spool

Entries should be of the form:

gm9xxx.ampr.org. IN A 44.131.14.254

But don't worry if Tabs / extra white space appears. The important bit
is callsign.ampr.org. Note the ampr.org. and the trailing full stop

Here are the entries in my autoexec.

```
#
domain addserver 44.131.178.10 20
domain cache clean off
domain cache size 20
domain cache wait 300
domain dns on
domain localtrans on
domain maxwait 20
domain retries 3
domain subnet off
domain suffix ampr.org.
domain trace off
domain translate on
domain ttl 864000
domain update on
domain verbose off
#
```

Source record: 37951

Paul,

I did some thinking about this problem about 5 years ago, but
I haven't actually implemented anything. Check the ARRL Computer
Networking Conference proceedings in that time frame.

I think it was the 1991 conference at which I presented my ideas
for minimum interference routing. This is very similar to, but
not quite the same as, minimum energy routing.

The idea in minimum energy routing is that once you implement
automatic power control in each node, you can construct a routing
table in which the link metrics to each neighbor are a direct function
of the power required to reach it. If you then let the routing
algorithm minimize the cumulative metric, you effectively find the
path that minimizes the total energy, summed over all the nodes,
required to reach that particular destination.

This idea was proposed some time earlier in the DARPA MSS (multiple
satellite system) project. I modified it somewhat for terrestrial
use by recognizing that the nodes are generally not evenly distributed,
and the topology isn't very uniform either. So I suggested picking
a routing metric for each neighbor that was a function of how
many other neighboring receivers you'd be forced to capture to reach
that particular node.

Again, the idea is to minimize the total interference caused in
getting a packet from point A to point B. With these algorithms,
the networks will automatically prefer a path consisting of many
closely spaced nodes over one involving long hops that require lots
of power. This helps maximize geographic reuse of the spectrum.

Phil

i am looking for a software based (ibm-pc) audio spectrum analyzer that is capable of record and play back of samples as well as being able to display pattern in real time(or as near to practical) while i am happy to pay a fair price i certainly as much as i would like to can't afford something like spectra plus v3 as that is usd$400 but something with features similar would be great.

hardware used:pentium90 running win95/win3.11 with 32 meg ram and sound blaster16 also have orchid soundwave 32(based on analog devices adsp 2115 chip)

intended use: viewing and analyzing patterns and spectra of hf digital signals as well as timings in the hope of gathering information to write software for decoding these signals with dsp devices.

any suggestions or pointers in the right direction would be great and appreciated

thanks in advance please e-mail replies

I seem to remember a thread on WEFAX that could be received with a
shortwave radio (not a full rig), a sound card, and some software.

Can anyone recommend a good 'listener's radio' that I could dedicate to WEFAX?
How about sound card WEFAX software for Windows?

In the book, I think you will find that there is a jumper you can yank off for a few secnds or so that will kill all the memory back to square one.

The next thing you have to do is kill one of the files in your configuration settings for your software. In the PacRat or however it is spelled directory, there is one of the files that is a .cfg file that has the IRQ and port info in it. Unfortunately, it is a binary file which you cannot edit, but is written in the required format when you first log into your PK232 in round one.

What has likely happened, is that you have now gotten a configuration file with the port and IRQ and baud rate in it that do NOT correspond to the factory default configuration.

If you read the manual, you will find that there is a way you can add the required port, baud rate and IRQ settings as hard parmeters in the command line call for the program. Provided that you know the right mix of things, you can force the unit to come up and then re-save all the stuff you set into it.

Without doing the forced init again this way, the only thing you can do is to erase the required configuration file and run the software again as if it were the first time and let it make a new configuration file,

OR

simply erase the files from the subdirectory and re-install it.

That will get you back working again.

Paul

you should have a look at HPWFFT1 - HpW Works demo software which is one of the best around that I have seen.

The author offers two versions of the software, a light version capable of 2048 points FFT and the full version which does 1048576 points !! The demo version is limited to 512 points.

Various sound cards are supported.

You can get the demo off compuserve, I dont know exactly which forum, probably where the other shareware is to be found.

In article <4imh3r$p6o@ns3.iamerica.net> brad@village.vonl.com (Brad Killebrew) writes:
>I need to be pointed in the direction where I can find a 56k modem
>(already built or kit is fine) and a UHF radio that can handle this

>type of xfer.

More info: The transverters and power amplifier for the WA4DSY 56kbps modem cost about $500 per interface (not including the cost of the modem), or at least that is the cost of the "RF deck" kit described at:
http://www.ve7ubc.ampr.org/users/www/56k/56rfdeck.html

So, since that $500 is too much, there is a big missing link here preventing that WA4DSY modem from becoming popular. And, the G3RUH in the SPIRIT-2 (ready for 38400bps) is similarly crying out for a radio on the market that can accomodate wide (60KHz) signals. Interesting.

Best Regards,
Gary

Try looking for a program called WINPAC...it runns in Windows '95..
If you check out the ham section of my homepaghe then there are some
good FTP links there where you can find it..

Sorry about being breif but i have a lecture in 5mins hehe!

I would like to hear of any experiences using cable TV coax for 70 cm
ham radio. I have a quantity of what appears to be 7/8 inch coax that
I assume to be about 75 ohm. The center conductor is about 3/16 inch
diameter. I ran about 125 feet between 50 ohm antenna and UHF radio
with 40 watts power. I adapted some PL-258 splice connectors to each
end of the coax and connected without any matching devices.
Unfortunately I have an unacceptable VSWR. I have ordered some matching
transformers that I hope will correct the problem but was wondering if
anybody has had good luck with this coax.
Like I said, I have 40 watts in, about 3:1 VSWR, and 7 watts into the
antenna at the end of the 125 foot run.

There is also pr4win at:

http://www.csesys.co.at/bstroj/pr4win.htm

You have both 16bit and 32bits native versions. You will need a KISS
capable TNC. I haven't tested it yet, but I plan to do it in a few
days. Looks pretty good from descriptions found at the address above.

Hi David,

As the file "new2tn2.02" says, the directory structure has
substantially changed in version 2.02 of TNOS. The "domain.txt" file
is now located under the "spool" directory. I suggest you getting the
file and reading it carefully. You can get it at:

ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming/new2tn2.02

or one of its mirrors. Hope this helps.

1555. native tcpip from win95 to 2meter?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-25 00:00:00 UTC
From: fkartsot@grtpa01.grt.ch.etn.com
Message-ID: <31569d9d.6869548@pgh.nauticom.net>
Source record: 38138

Has anyone used dial-up networking in win95 to get onto 2 meter tcpip? Seems to me its not necessary to use a third party nos when win95 comes with a real nice tcpip package. Is tcpip on 2 meters using slip or ppp? I know win95 can handle mutlihomed connects as i can easily be on a LAN and dial-up to my ISP via dial-up networking. Windows knows where to send the packets and does quite well. This same feature would make a nice 32bit connection to 2 meter tcpip.

has anyone given this a try?

1557. AX.25 checksum in tcp/ip

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-25 00:00:00 UTC
From: bhorne@lynx.dac.neu.edu
Message-ID: <4j6fcr$n4m@chaos.dac.neu.edu>
Source record: 38140

We've been analyzing the load on our tcp/ip backbone, using a product intended for AX.25 traffic. This package detects resends by comparing the AX.25 checksum with values previously received: with tcp/ip UA frames, however, we're not showing any resends.

The question, then, is: should packets resent by the tcp layer have the same info in them, time after time? What would change from packet to packet that would cause the AX.25 layer to recalculate the checksum?

Thanks for your help.

>it looks like USA Amateurs have priviledges in the 33cm band, from 902-928
>MHZ, all modes. My first question is, do we still have them?

Yes. Government radiolocation is primary, private radiolocation is
secondary, and we are tertiary. Part 15 devices are below us in
the priority scheme.

>2) It was my understanding that amateur digital communications must contain
>the callsign of the sender. A local HAM here said the rule is much stricter
>and that amateurs must use the AX.25 protocol ONLY, for digital
>communications. Is it true we are limited to only using AX.25 for digital
>communications?

No. We can use unspecified codes here, see 97.309(b). We must ID in
a recognizable manner at the normal intervals of course. We are limited
to the use of AX.25 only if we intend to do unattended automatic forwarding.

>3) Essentailly these cards operate from 904 MHZ - 926 MHZ. I have been told
>that this is too wide of a channel. What is a "channel" and is this true?

These cards operate *spread spectrum* which means that the signal energy
is spread over a channel bandwidth of 22 MHz. This is *not* too wide a
bandwidth for the 33cm band. The rules only require that the signal energy
be contained within the band, and this qualifies.

However, we have more severe limitations on spread spectrum operation than
on ordinary digital signaling. See 97.311. The capsule summary is that
we are only allowed to use certain spreading sequences, and the cards you
have *don't* do those spreading sequences. So unless you can modify the
cards to do one of the allowed spreading sequences, you can't use them
under Part 97. (Note: there is currently a docket before the FCC to relax
this requirement. The FCC may act on it at any time, watch www.fcc.gov
for updates.) Also, SS emissions must be identified using Morse Code
in such a manner as to be receivable on a narrowband receiver. This
will also require modifications of the cards.

>Those are my specific questions, however I'm essentially looking to find the
>official rules for digital communications in the 33 MHZ band is, and whether
>or not the FCC limits me to only using the AX.25 protocol.

Every amateur should have an up to date copy of Part 97 in his station.
All the rules are in there. As a quick fix, go to

www.accessone.com/~vbook/hronline.htm

and browse the reference section for an online copy of Part 97.

You aren't limited to that RF deck kit. We've been using Microwave
Modules MMT432S transverters since the modem was designed. They work
fine, and can be found at hamfests for around $160 (I'm told that
a limited supply of brand new ones have also been located in Britain).
Also, Maple Leaf Communications has some Sinclabs 220 MHz transverters,
which are essentially MMT clones, for around $250, and they also work
fine. And Down East Microwave has a 70 cm transverter kit for $155,
and it works fine too. We have even used the Hamtronics XV4 upconverter
and 70 cm receive converter with the modems, but that isn't recomended
unless the distance to be spanned isn't great, and the site isn't a high
RF site.

10 watts is plenty of power for any line of sight path. Actually,
3 watts is usually fine. If the path is not line of sight, multipath
may cause excessive symbol smearing and a higher BER, and this can
be *aggrevated* by running higher power levels.

Sounds like you have a bad piece of cable, Gene. Or you did something
horribly wrong when installing the connectors. You should be seeing
a VSWR of about 1.5:1 and a power out of around 38 watts.

You also know that you can cut the 75 ohm cable to a multiple of
a halfwave and get a perfect repetition of the antenna impedance
at the radio, don't you? You'll still have a 1.5:1 VSWR on the
cable, but your radio won't know it.

Hi Gary.

Perhaps you can clarify...does this mean I can transmit "spread spectrum"
om 2 meters, and use all the band (ie; 144 t0 148)? Wouldnt this interfere
with...well...everybody on 2 meters?

Maybe Im missing something here... :(

This problem is almost ALWAYS from RF getting into the computer
when it starts transmitting.
Most laptop users find it first, because they're using an HT
which is about a foot away from the computer.
So, use an outside antenna, as high up as you can get it. This
will also help to avoid hidden-transmitter collisions. Then do some
shiedlding and grounding. Use some ferrites on the cables between
radio, baycom, and computer. Ground everything you can. I'm quite
sure this will solve your problem.

1564. GE Master II query

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-03-26 00:00:00 UTC
From: cgreenha@magnus.acs.ohio-state.edu
Message-ID: <4j9564$ftg@charm.magnus.acs.ohio-state.edu>
Source record: 37954

Hello all.

I just got my hands on a GE Master II UHF rig with remote console, mic, external speaker, and interface cable...basiclly complete.

I am wanting to put it on 9600 bbs packet. Since this is a rock bound rig (has 8 "channels"), will it work well?

Someone also told me this is a 90 watt unit...does anybody have ANY information on this radio...watts, amp draw, pin out on console, schematic, crystal source...anything at all, including what it is worth, would be most appreciated.

Thanks much, & take care.

>MHZ, all modes. My first question is, do we still have them?

Yes we still have priviledges in this band, although with all the
"junk" from cordless phones and the like, the noise floor is high and
is getting higher every day.

>2) It was my understanding that amateur digital communications must contain
>the callsign of the sender. A local HAM here said the rule is much stricter
>and that amateurs must use the AX.25 protocol ONLY, for digital
>communications. Is it true we are limited to only using AX.25 for digital
>communications?

AX.25 is not the only authorized protocol. As long as the protocol is
available for "inspection" (i.e. it is published somewhere) and is not
encrypted, the protocol is OK. Part 97 rules require that while
operating in a spread spectrum mode that you ID in a narrow band (i.e.
FM or CW) also.

>3) Essentailly these cards operate from 904 MHZ - 926 MHZ. I have been told
>that this is too wide of a channel. What is a "channel" and is this true?

>Those are my specific questions, however I'm essentially looking to find the
>official rules for digital communications in the 33 MHZ band is, and whether
>or not the FCC limits me to only using the AX.25 protocol.

Spread spectrum is limited to 440MHz and above. The main thing to
watch out for is the spreading sequence (the "coding" that spread the
signal over the 26MHz allocation). Hams are only allowed to use
certain spreading sequences, although this may change soon. Its
probably impossible to determine what spreading sequence the cards are
using--its probably not one designated to ham use.

Source record: 37956

G'day ! Any amateurs bought and used this board for experiments ?

I built a 'Techno Wizzy' DDS kit from the states a few years ago and it was a nightmare. Spurious garbage all over the place, with most spurii only 5-10 dB down from the desired signal, I mean MASSIVE junk.

I'd like your comments and/or advice on this board because I'm contemplating buying one. Yeah, been to Novatech's web site and it looks good, but there's nothing like getting the real drum on a device, rather than the promo spiel (which is always rosy!)

Comments to umbra@opennet.net.au please !

Hay, it's cheap and it works... What else can you say.

>Unfortunately I have an unacceptable VSWR. I have ordered some matching
>transformers that I hope will correct the problem but was wondering if
>anybody has had good luck with this coax.

Some thing was wrong. Check the SWR formula a mismatch from 75 to 50
should not have caused this reading. I use 100 feet of TV coax for my
two meter repeater. No matching at all! Even with the small swr caused
by the hardline to antenna miss-match the loss is STILL lower than if
i ran coax....

Dear All,

I live in Fleet Hampshire (UK). I know a lot about TCP/IP
and Unix and setting up Internet gateways (I do it for a
living). I am very interested in all aspects of radio data
comms and would like to know more. Therefore, can anyone tell
me if there is a club close to Fleet and how I contact them, or
if any knowledgable person in the M4 corridor could spare an
evening (Ill buy the beer)

Thanks

Lyndon David.

1572. >>>>HELP - Small VHF Xmitter for Airborne Telemetry<<<<

Newsgroup: rec.radio.amateur.digital.misc

From: BlueSky@tiac.net
Message-ID: <31585402.72C6@tiac.net>
Source record: 37962

Can someone help me by pointing me to a schematic or an article of a small VHF transmitter? It is
to be used to relay telemetry from a series of high altitude rockets. Following are the (desired)
specs:

Frequency: 2m band or nearby; XTAL controlled;
RF Power: 50-250 mW output;
Supply: 9-12 VDC (battery);
Modulation: N/A

Complexity (ie. size and weight) should be as low as possible, as should the cost - lets face it -
the typical life of these devices will be measured in minutes. I would preffer to build the xmitters myself as integral part of a telemetry package.

I have hundreds of various scanner crystals that fit in this category. They have fundamental
frequencies around 16MHz, but I don t really know if I can use them for this project.

I would very much appreciate any help in this matter. I can be also reached at

mailto:BlueSky@TIAC.net

My thanks to all those who reply!

When you enter a reset command, the baud rate goes back to a default rate
but I don't know what it is for sure. Look in the manual. What it is
waiting for is someone to type an *. That will enable the TNC to
autodetect the baud rate. Even if you do the hard reset on the PK-232,
you will have to figure out how to enter the *. How you enter it
is really dependent on your software. I suggest reading the
docs that came with the software to see if it covers resets.

Jim.

>Maybe Im missing something here... :(

You're missing a couple of things. A) SS is not allowed on 2m (under the current rules), and B) by spreading the signal energy over a wide bandwidth, the amount of energy at any given frequency at any given time is miniscule, so it doesn't interfere with narrow band users, and of course SS users have to have their sequences synchronized in order to hear each other, so by syncing to a different part of a sequence, or to a different sequence, they avoid interfering with each other too.

As a band fills with many SS signals, the only thing noticable to a user of the band is a gradual rise in the apparent noise floor. Unlike with narrow modes, there is no clash of titans as signals overlap each other, no hetrodyning, splattering, buckshotting, and desensing of each other.

The thing that makes this possible is called "correlation gain". A SS receiver is a perfect matched filter for a SS transmission. It effectively sums all the signal energy back into a coherent despread whole while *not* correlating noise (and other signals on the band not synced to the same sequence are for practical purposes noise). So while to a narrowband user a SS signal is inaudible, to a user with a synchronized SS receiver it is loud and clear. And besides the natural and automatic load spreading and band sharing inherent in SS, there is also another positive attribute of SS, and that is good immunity to multipath. Because it transmits on many frequencies, it forms a frequency diversity system resistant to multipath.

Use of SS is fully compatible with FM, repeaters, ATV, SSB, and
CW operations. The only operators adversely impacted by SS operations
are narrowband weak signal operators. Because of the apparent rise
in the noise floor, very weak signals can be adversely affected.
To avoid that, certain band segments need to be set aside for this
use, and SS systems should use sequences that avoid spreading into
those weak signal segments. That's pretty easy to arrange. Of course,
weak signal operators could *also* take advantage of SS technique and
not be as adversely affected. The inherent diversity in the technique
would be useful to deal with Rayleigh scattering and Faraday rotation
encountered by EME operators, for example.

In article <315769B9.41C67EA6@qualcomm.com> Phil Karn <karn@qualcomm.com> writes:
>Again, the idea is to minimize the total interference caused in
>getting a packet from point A to point B. With these algorithms,
>the networks will automatically prefer a path consisting of many
>closely spaced nodes over one involving long hops that require lots
>of power. This helps maximize geographic reuse of the spectrum.

Two things to note, however. Interactive latency increases geometrically
as the number of relay hops increase on any given path. And it only takes
a very few "exposed" terminals to crash the entire area wide system, IE
from some sites you just can't throttle power back enough to simultaneously
connect with *somebody* without also being heard by nearly *everybody*
else.

Unlike commercial systems where site location can be closely controlled,
amateur networks have to deal with where the amateurs are, not where they
ought to be for best network performance. Given the relatively small
number of operators and their rather arbitrary and uneven geographic
distribution, other topologies and metrics are likely to perform better.

Either use of duplex digital repeaters on high sites, or use of non-
contending spoke and hub microwave directional systems, are one or both
likely to be better than this quasi-cellular approach given amateur
numeric, geographic, technical, and financial realities and considering
average latency and the ability of a few exposed terminals to seriously
degrade the quasi-cellular system.

Note that if the system were true cellular, with relay done on trunks
operating on a different channel(s), then the system would be much
better. But that requires a degree of political cooperation and financial
investment beyond most area's amateurs.

Note, however, that unless you are fortunate in the length that you
choose (mulitple of a halfwave), or you are using a circulator at
your duplexer output (normally the circulator would be between the
duplexer and the transmitter instead), the reactance presented by
the mismatched line to the output cavities will detune them. This
is really no big whoop, but it does mean that you'll have to do
final cavity tuning in situ in order to absorb that reactance into
the cavity's final tune. Otherwise you may find that the repeater
sensitivity is much poorer than it should be.
